

Dairy

Dairy plants are required to be of the highest sanitary standards, with a need for continual cleaning, such as CIP (Clean in Place). They are also environments that need to be free from dust, with the risk of dust explosions. The BFM[®] fitting is the perfect solution. As well as offering a media that is more abrasion resistant than traditional connectors, the BFM[®] is easily replaced (less downtime), easily cleaned, and dust tight (eliminating plant contamination).

HYGIENIC DESIGN EXCEEDS STANDARDS

BFM[®] fittings are 3A certified, as well as being USDA, FDA and EU approved for food contact.

TRADITIONAL CONNECTORS

Dust Leakage

Internal pressure pushes connector away from spigot with dust leaking.

Product Build Up

There is a contamination point with conventional connectors which is a hygiene risk.

BFM[®] FITTING

Perfect Seal - No Leaks

Increase the pressure and the tighter the BFM[®] connector fits. No leaks and no mess.

THOROUGHLY TESTED

An extensive range of in house and independent testing has proven that the BFM[®] fitting is a superior system. Explosion testing has been a significant part of this.

Our independently verified testing proved the failure of hose clamped connectors in explosion situations. It has also been proven that the BFM[®] fitting will withstand and contain an explosion.

Some of the leading dairy companies using the BFM[®] fitting around the world include:

Dairy for life
