

DVD SLIDESHOWS

The simple act of putting your digital files onto a DVD will not guarantee that the photos will play on a DVD player – it might, it might not – and if it does, the vertical images may not be the correct way up. Different brands of DVD players have different software, and different ways of displaying images.

The one way we have found that we know will work on all DVD players is that we convert the digital images (photos, slides or digital files) into a video slideshow, and it will then play as a movie on the DVD player.

When we do this, we also rotate all images so they are correctly orientated on the screen. Our standard settings are a 3 second transition, and 10 seconds for the image, but this can be changed on request. You can also “speed up” or “slow down” the slideshow using the fast forward or rewind buttons on the remote control, or stop it on a photo using the pause button.

If the slideshow is required in a different format such as avi, quicktime, mp4 etc please ask for details before we create the slideshow.

MP4 files are the standard we use when putting slideshows onto USB drives, but .avi files can be supplied.

If you already have a DVD slideshow, it will need to be converted as per costs on page 28.

1 to 100 files	\$70.00	
Per each additional 100 images	\$50.00	up to 999 photos (Max)

Minimum charge on all scans \$6. Duplicate disc \$10
