Maritime Vision System

Westcon Power & Automation's long experience as a system integration house in the maritime, energy and oil & gas industries ensures that all of the customer's vision system needs will be taken care of. As a supplier of integrated computer systems, we specialize in bringing together the hardware and software components into one single supply; ensuring excellent interaction, functionality and user experience.

Highly experienced technicians and engineers will be available throughout the entire lifetime of the system, and will be capable of providing the following:

- Site surveys and project management
- General and custom-made system designs
- Engineering, documentation and drawings
- Factory Acceptance Tests and training
- Mechanical and electrical installations
- Network termination and testing
- Installations follow-up, commissioning and 3rd party integration
- Global 24/7 operational support, troubleshooting and service

Modern engineering and production tools, together with excellent facilities at our own premises assure full control of the progress and quality of the assemblies before these are shipped to site. Skilled installation and service personnel will ensure that the system functions in an efficient and flexible manner with the interests of the client in mind. Our technology partner, Last Mile Communication, has both in-depth knowledge and system solution expertise. This will help to assure that our vision system will be the ideal choice for our customers.

The Maritime Vision System (MVS) is based on an Open platform IP video management software (VMS) from Milestone System. The black box epoch is over! The MVS runs on standard IT hardware. The MVS gives the customer freedom of choice of hardware components and future integration possibilities.

The MVS together with state of the art IP video cameras makes this a perfect solution for the marine, oil and gas markets. Extreme focus on easy installation, operation and maintenance are the key words. A significant reduction in components, compared to that of traditional CCTV, saves both time and money for the installation, operation and maintenance. The high quality of the images from the cameras and the state-of-the-art user friendliness cannot be compared with traditional CCTV systems.

The option to easily distribute video to a variety of users and places provides added possibilities. The complete lifecycle cost and ROI are important factors when considering an investment in this product.
