

## Who We Are

XSOLIS is a platform, data science, and solutions innovator focused on creating a more efficient healthcare system. Our solutions eliminate waste through the science of data – using automation, transparency, and objective insights – to ensure appropriateness of care.

## What We Do

We deliver purpose-built solutions and industry-leading artificial intelligence (AI), to ensure optimized Utilization Management (UM) processes and data-driven collaboration across a connected network of providers and payers.

## What Makes Us Different

Traditionally, status determinations have been made with the aid of two major screening criteria tools. The use of these legacy tools can result in static and subjective decisions that do not reflect the ever-changing picture of the members' health status.

XSOLIS' flagship solution, CORTEX, analyzes member data in real-time and offers objective insights to support clinical decision making and an optimized UM process.

Further, CORTEX allows for the payer to engage and collaborate in the determination of medical necessity which results in increased clinical efficiencies and reduced administrative burden.

**CORTEX is currently used by over 300 hospitals with over 100 connections to payers/plans. Over the past year, XSOLIS has grown its payer network by 111% and its hospital partnerships by 44%.**

## KEY FEATURES:

### Real-Time Analytics

XSOLIS' CORTEX platform eliminates data silos by extracting data from the EMR, applying NLP and ML to provide real-time updates of the member's clinical picture that can be accessed by both providers and payers.

### Access to the Same Data

National, regional, local, and provider-sponsored health plans as well as hospitals and health systems are leveraging CORTEX for an EMR agnostic, shared framework for accessing and collaborating on cases for review.

**Leveraging Precision UM, payers can streamline case review time for determinations by 77%**

### Advanced Automation

Without AI or ML to help inform the member's clinical picture, reviews become subjective, creating conflict, frustration, and inefficiencies between providers and payers. Using data, providers and payers can automate inpatient and observation status determination through mutually agreed upon thresholds - a process called Precision UM.

### Facilitates First Touch Determinations

By sharing real-time data and an objective clinical picture, CORTEX reduces administrative burden and creates efficiencies through First Touch Determinations - with faster decisions and substantial financial savings for both payers and providers.

**"If everyone is looking at holding onto their data as a competitive advantage, that won't work anymore. Instead, it should be about how we can improve everything for everyone."**
