### **Risk Assessment & Method Statement**

#### Installation of Door Holdback Devices (24V)

#### Scope of Works

To carry out Installation of 24V magnetic door holdback devices. The process carried out is detailed in the method statement

Firstly, we will confirm that this Risk Assessment is relevant and accurate in relation to the activity at hand. In conjunction with any Site Supervisor/Responsible Person/Informed Person present on-site we will ascertain any hazards and associated risks outside the scope of these RAMS; for example, issues associated with other trades or the general public being present on-site, issues with access/egress, issues with obstructions, obstacles, uneven surfaces, issues with lone working, etc.

Should additional hazards and associated risks be identified a dynamic risk assessment will be undertaken and reasonable protection control measures will be detailed and put in place.

All Fixfire engineers will ascertain whether a site induction will be conducted by Supervisor/Responsible Person/Informed Person at site and will attend the required site induction before commencing any works on site. In instances where site inductions do not form part of the customer's Health & Safety process, Fixfire engineers will instead carry out a site induction with relevant parties as necessary.

All health and safety information and site arrangements that are updated throughout the term will be communicated to employees upon receipt of the information.

The risk assessments and method statement will be reviewed upon attending the site to ensure all hazards are addressed and any hazards outside of the scope of this generic assessment will be noted and communicated in a dynamic risk before the commencement of works.

The engineer carrying out the works will be required to read and familiarise themselves with the hazards identified within the risk assessment and confirm that the safe system of work has identified any hazards and the methodology has carefully considered these during its completion

#### Risk Rating Calculation

Risks identified can be scored as to severity, frequency of exposure and the probability of the accident occurring.

| SEVERITY<br>(S)                           |       | FREQUENCY<br>(F)                 |       | PROBABILITY OF OCCURANCE<br>(P) |       |  |  |  |  |
|---|-------|----------------------------------|-------|---------------------------------|-------|--|--|--|--|
| Description                               | Score | Description                      | Score | Description                     | Score |  |  |  |  |
| MINOR<br>Scratch/Bruise/Cut               | 1     | SELDOM<br>Four Times per Year    | 1     | UNLIKELY                        | 1     |  |  |  |  |
| SERIOUS<br>Fracture, Breakage, Laceration | 3     | OCCASSIONAL<br>Weekly or Monthly | 2     | POSSIBLE                        | 2     |  |  |  |  |

#### **Method Statement & Risk Assessment**

## Installation of Door Holdback Devices (24V)

#### **DETAILED METHOD STATEMENT** (State precisely the tasks that you will complete when completing the work) Task No Method Statement (installation of door holdback devices 24V) 1. The Fixfire engineer will firstly sign in and carry out a safety induction. All equipment brought onto the site will be fit for purpose and inspected and tested prior to commencement of works. The following methodology has considered all the hazards associated with the works and a safe system of work produced. First Aid & Evacuation Our engineers will be advised of actions to be taken in the event of an accident or incident at the Safety Induction. Accidents and Near Misses will be reported to the Client's Site Supervisor and Fixfire Head Office and will be recorded in the Fixfire accident book. In the event of an accident, the Client's supervisor will contact the emergency services if appropriate. In the event of an emergency evacuation of the building, the engineer will go straight to the muster point as detailed in the induction. The engineer will assemble at this point where a roll call will be taken. In an emergency, any instructions given must be obeyed by the engineer. Lone Working There may be on occasion the need to work 'Lone' when either in a plant room or during agreed weekend working. Fixfire will confirm that the Engineer who will carry out any 'Lone Working' is medically fit to work in the agreed environment and will ensure that regular two-way communication by phone or radio is in place with either the site supervisor or the office. The Engineer will use the sign-in/out system in place on-site and will confirm there is no hazard present from extremes in temperature in the working area. Lone working will be for short periods ONLY. **Equipment Used** Stepladders a) Insulated screwdrivers b) c) Pipe & wire detector Handheld drill d) Safe Use of Step Ladders Use step ladders for short duration works and for a maximum of 30 minutes before a rest break should be taken. A minimum of 3 points of contact will be maintained, and stepladders to be placed on firm level ground and facing in the direction of the works. Stepladders will be positioned side onto the work as may become unstable when pressure or force is applied. Stepladders will be inspected before use, consulting HSE Guidance document INDG 455. Commencement of works as follows: 2. Before works commence the Fixfire engineer will agree the position for each door holder (this can be floor or ceiling mounted), including a suitable mounting position for the magnet behind the door open position. The back push switch (which is used to release the door manually) will be easily accessible when the door is retained open The Fixfire engineer will consider the age of the property and consult the Asbestos Register, if necessary, when planning the 3. route for the new cable from the PSU to the MDR. Then, using the appropriate access equipment, they will install MDR cable into containment, along purlin or surface clipped. 4. The Fixfire engineer will isolate power to the PSU and will connect the 24V power cables to the terminal block accessible through the base plate. 5. The Fixfire engineer will fit the base plate securely to the mounting surface using four suitable fixings and fit the keeper plate assembly to the door using four screws so that it aligns with the magnet face 6. They will connect the electrical supply to the PSU and check the magnet will hold the door open. 7. Check that the door closes when the fire alarm is triggered and when the release switch is pushed. 8. Once works complete waste and unwanted items will be removed from site. 9. The Fixfire engineer will complete report of works on their PDA, advise the customer of the works carried out, remove all equipment leaving works area clean and tidy and then sign out.
