

# ENVIRONMENTAL REQUIREMENTS FOR SUPPLIERS

The supplier must survey the environmental impact linked to the performance of the service/delivery.

By environmental impact, we mean the conditions that will affect the environment in the form of energy consumption (e.g. fuel), resource use (e.g. packaging) and general consideration of the external environment.

The supplier must incorporate routines for control of the environmental aspects relating to the service/delivery.

If the suppliers are certified according to recognized environmental standards, the above requirements are considered satisfied.

The transport must be carried out in such a way that the environment is affected as little as possible.
