

Case Study: St. Francis Healthcare Partners, Inc.

Summary: St. Francis Healthcare Partners, Inc., in Hartford, CT is a private healthcare company with about 100+ end users. St. Francis was moving from their existing environment due to expansion. Since they were breaking away from their old environment, they needed a new data center, infrastructure, technologies and IT management. WCA helped them migrate from their current environment and implemented all new infrastructure and managed how their data is maintained and stored.

Challenges: Since St. Francis was moving completely from their current business and environment, they needed their own infrastructure and to move large amounts of existing data while maintaining productivity. St. Francis is a healthcare institution which also meant they had to be HIPPA compliant, and experience no down-time during the project. They needed remote-based options as well.

Solution: WCA provided a smooth transition for St. Francis to their new environment. WCA helped St. Francis move their infrastructure and desktops to the cloud, giving their employees mobility-based options for a remote workforce. New switches were installed on their new floor, a new wireless AP and an Aruba access point. In addition, WCA's Managed Services team is currently maintaining and managing their end users.

Benefits: WCA was able to provide full services such as cloud-based IT systems, IaaS, virtual desktops and full Managed Services. WCA was also able to provide support to end users and manage their complete IT solution. This created a new highly mobile, manageable and expandable desktop experience for St. Francis. With WCA's help they were able to successfully break away from their current environment while still maintaining productivity and scalability.
