

Damaged power lines can hide for days before starting a fire.

Fewer Fires.
Shorter Outages.
Lower Costs.

Get Real-Time Damage Alerts.

How does it work?

Drone installed line and pole mounted sensors detect incidents of all kinds and send alerts and GPS pin drops via cellular or satellite when they detect a mechanical failure, or when environmental conditions indicate that there is a potential for damage.

Why is this better?

It's the only system that automatically detects mechanical failures. It's far more affordable, dependable and can be installed using drones and requires no maintenance.
