Honda Fit Engine Intake Restrictors

January 27, 2023

The Honda Fit engine is required to have an HPD supplied air inlet restrictor with internal diameter of 30.5mm and thickness of 3.175mm (0.125 inches) correctly installed within the intake system. **The restrictor may not be modified in any way**; the specified value can not be exceeded in any measurement of the diameter. The restrictor centerline or shape must not be altered. FRP will have go-no go gauges to verify that all competitors are in compliance.

An unmodified HPD gasket must be correctly installed on both sides of the restrictor. Non HPD provided restrictors or gaskets are not allowed.

We remind competitors it is their responsibility to present a legal engine to any FRP event. Technical penalties for non-compliance accrue to the driver and not a team or engine builder.
