LTC ACO
The ACO for Long-Term Care Residents

Q3 Clinical Roundtable Recap: LTC ACO is harnessing the power of AI with new ClosedLoop Reporting

LTC ACO's Q3 Clinical Roundtable spotlighted our partnership with ClosedLoop, whose AI/ML data science platform will help improve LTC ACO beneficiary outcomes and reduce unnecessary costs with accurate, explainable, and actionable predictions of patient-level health risks.

Over the past several months, LTC ACO and a multi-disciplinary team of ACO clinicians have consulted with ClosedLoop's data scientists to design and evaluate clinical models specifically trained on LTC ACO's long-term care patient population – your patients - to assure relevant and accurate predictions of future health events such as avoidable hospitalizations and mortality.

ClosedLoop's models identify patients most likely to benefit from specific primary care interventions. We've begun rolling out practice specific ClosedLoop reports that identify patients at the highest risk of avoidable hospitalization, along with relevant clinical data and recommended interventions via a dynamic worklist.

These AI models mature and improve over time as they assimilate more claim and clinical data, and with your input, as you share actions taken based on the models' recommendations. Your feedback – returning the worklists with actions taken – is essential to the evolution and accuracy of future predictions.

The predictive reporting offered by this initiative holds the promise of significantly improving quality of life and care for beneficiaries and their families, and your ongoing collaboration on this work is essential to its success. Your insights and suggestions are important to us!

We wholeheartedly invite you to share any insights, questions, or success stories you may have. Please reach out to your organization's Partner Engagement Manager (PEM):
