

CLEANING AND DISINFECTING INSTRUCTIONS MURA™ COMPOSITE PANELS AND TILES (unprinted) (Ion, Zen, Muse, Muse Tile, Ascent, Wave and Dune)

UPDATED MAY 2020 IN RESPONSE TO COVID-19

The Australian Government's Department of Health (2020) suggests that the length of time that SARS-COV-2 (the cause of COVID-19) survives on inanimate surfaces will vary depending on factors such as the amount of contaminated body fluid present, such as respiratory droplets, and environmental temperature and humidity. It is unlikely that Coronaviruses will survive for long once droplets produced by coughing or sneezing dry out.

World Health Organisation (2020) and Safe Work Australia (2020) recommend a combination of cleaning and disinfecting as the most effective way to remove the COVID-19 virus from surfaces in the workplace. They make the following distinction between cleaning and disinfecting:

Cleaning is the physical removal of germs, dirt and organic matter from surfaces. **Disinfecting** is using chemicals to kill germs on surfaces.

It is important to clean before disinfecting because organic matter and dirt can inactivate the ability of disinfectants to kill germs.

Mura™ composite panels and tiles are generally used on wall surfaces that the Department of Health (2020) deem minimally touched and following the cleaning instructions below when wall surfaces are visibly dusty or soiled is considered adequate. Cleaning will reduce the soil load on the surface of panels and tiles, allowing a disinfectant to work and kill the COVID-19 virus.

CLEANING

Warning: Do not saturate Mura™ Composite Panels and Tiles with water or other cleaning liquids.

REGULAR CLEANING

Vacuum regularly using low suction and smooth attachment.

Clean with hot water extraction machine (hot).

Professional cleaning recommended.

Do not use dishwashing or laundry detergents, only use upholstery detergent.

Allow to dry away from direct heat thoroughly before re-use.

SPOT CLEANING

Treat spills and stains as soon as possible.

Avoid concentrated rubbing and use minimal pressure only.

Gently scrape soil or mop liquid from the surface of the fabric, do not scrub.

Apply proprietary cleaning agents strictly according to instructions to remove the residue of the spill.

Dry cleaning solvent can be used for spot cleaning.

Ensure adequate ventilation if the product is likely to be subject to excessive moisture.

DISINFECTING

The Department of Health (2020) suggests the use of a disinfectant for which the manufacturer claims antiviral activity, such as commonly used chlorine-based disinfectants like household bleach with active ingredient Sodium Hypochlorite or hospital grade disinfectants with active ingredient Benzalkonium Chloride or min 70%-90% ethanol alcohol solution (WHO, 2020).

A variety of strengths of household bleach are available. The concentration of active ingredient can be found on the product label. The Department of Health (2020) following World Health Organisation (2020) recommendations suggests using a 1000ppm (0.1%) bleach solution and for larger bodily fluid and blood spills a 5000ppm (0.5%) bleach solution.

For example; White King Premium Bleach has a concentration of 4.0% Chlorine, so to achieve a 0.1% bleach solution, you would use 1 part bleach to 39 parts water or 250ml bleach in standard 10L bucket of water.

Note: Appropriate personal protective equipment (PPE), such as gloves and protective eye wear, should be worn when handling and preparing bleach solutions or disinfectants.

PREPARATION AND USE OF BLEACH SOLUTION

Bleach solutions should be made up daily using manufacturer's instructions for appropriate dilution and use. Using a disposable paper towel or cloth, wipe the cleaned surface of Mura™ composite panel or tile with bleach solution.

Sufficient time is required to kill the virus, i.e., at least 10 minutes contact time.

USE OF DISINFECTANT OR ALCOHOL WIPES

Using a disposable disinfectant wipe with active ingredient Benzalkonium Chloride 0.47% w/w or min 70% ethanol alcohol, wipe the cleaned surface of Mura™ composite panel or tile.

Sufficient time is required to kill the virus, i.e., at least 10 minutes contact time.

Please refer to individual product specification sheets for care symbols.
