

Python Developer

Who we are:

Since Airelogic was founded in 2007, we have been committed to improving the relationship between technology and clinical practice. We have been involved in some of the largest healthcare projects in the world, with clients ranging from the NHS to the Singapore government.

However, we are equally involved in supporting smaller projects and have done extensive work with individual trusts or organisations on bespoke, local projects. Airelogic's activities fall broadly into three categories: offering technical consulting on architecture and IT strategy, providing agile delivery and DevOps services, and creating innovative healthcare IT solutions.

Naturally, these areas have a lot of overlap, and one of the main strengths of our company is that we have experience across of all stages of an IT delivery programme, from the initial strategy and architecture, to implementing an appropriate solution that will achieve your organisation's specific aims.

Our healthcare product - forms4health - is breaking ground in healthcare technology allowing the clinicians and business to have far greater control over their digital solutions. We have spent a substantial effort making the product highly usable across all form factors.

What we expect from you:

- Strive to achieve high quality standards and be flexible to meet both Aire Logic and our Customer requirements
- Cooperate, collaborate and knowledge share with Customers and build positive relationships
