

WG M Random Search Selector

WESTMINSTER
GROUP PLC

Product Code: 1095-18

Overview

The WG M Random Search Selector is a mains powered unit ideal for situations where you may need to select individuals from a group, when it is either impractical or undesirable to search everyone passing through a control point.

This device prevents any risk of being accused of discrimination or favouritism. Whilst each activation of the selector button by those pressing it will result in a totally random “Search” or “Pass” result, overall, the selection percentage as set by you, will be maintained.

How it works:

Everyone passing through the control point presses the large red activation button.

Each time the button is pressed; the clever algorithm in the on-board computer calculates a “Pass” or “Search” result and illuminates the appropriate indicator.

The randomiser algorithm ensures that each individual result is totally unpredictable, while the system maintains the overall “Selection Percentage” set by you.

WG Random Search Selectors are often used in conjunction with security metal detectors such as walk through knife arch type or inexpensive hand-held metal detector wands.

Applications:

- Airports & border control
- Schools & colleges
- Retailers (to combat staff pilferage)
- Manufacturers (quality control checks)
- Health and Safety officers
- Vehicle fleet managers (i.e. for spot checks on vehicle safety or loads)

Optional Accessories

Remote Indicator

The Remote Indicator also connects by cable to the mains unit and could for instance be located as an extra indicator within the adjacent security office

Remote Activation Button

The Remote Button connects by cable to the mains powered Random Search Selector Unit. It offers the flexibility to position the Activation Button in the most accessible place for users
