

# CHARTER

## CYBERSECURITY AND GRC CONSULTING SERVICES

*Unlocking the Power of Protection*

### Firewall Security Configuration

Charter can conduct a comprehensive firewall review to ensure that your firewall is configured to meet security and resiliency requirements, providing the intended security benefits. This service assists your organization in identifying potential vulnerabilities, aligning to compliance with security policies, and enhancing your overall network security posture.

### Penetration Test

Charter can conduct a penetration test, which is an authorized simulated attack performed on a computer system to evaluate its security. This service helps you identify vulnerable areas and proactively address weaknesses before hackers can exploit them. By simulating a variety of attacks that could threaten an organization, we can examine whether a system is robust enough to withstand attacks from authenticated and unauthenticated positions, as well as various system roles.

Empowering Organizations through Comprehensive Network Protection

### Risk Assessment

Charter's team of risk professionals can assist your organization in identifying risks, gaining transparency, creating value, and strategically managing outcomes for success. While risk management is commonly used to identify potential issues, Charter adopts a broader perspective by exploring ways in which risk can bring about advantages and value. We take a practical approach and leverage our industry insights and extensive knowledge to identify, analyze, and evaluate risks. Subsequently, we provide customized solutions to address and monitor ongoing risks.

### Zero Trust Architecture

The Zero Trust approach is an essential security strategy that verifies and secures every identity, validates device health, enforces least privilege, and captures and analyzes telemetry to better understand and secure the digital environment.

In addition to Microsoft or Cisco Zero Trust Architecture Reviews, Charter offers additional value-add services with these technologies, such as Roadmaps, Strategies, Business Cases, and Implementations of Microsoft 365 E3 & E5 Security, Compliance & Sentinel, as well as Cisco Secure's family of products, including Duo, Umbrella, Secure Endpoint, Secure Email, and Cisco Extended Detection and Response (XDR).
