

Manufacturer's Declaration

Compatibility of Tigo technology with Omnik Inverters

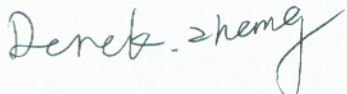

All of Omnik inverters are compatible with PV modules with Tigo Smart Module and Tigo Retrofit "Add-On" optimizers.

As long as the design of a solar power system with e.g. "Solar Design" ensures that the permitted operating range of all components is kept at all times, the operation of Tigo technology(all smart j-box and "add-on" versions), in combination with Omnik inverters poses no breach of the warranty conditions of these products. The specification of the operating range of the inverters is documented in the respective manuals or installation instructions.

Warranty claims are contingent on the following:

1. Maximum photovoltaic system voltage does not exceed the maximum input voltage of the inverter.
2. Omnik takes no responsibility for the achieved yield of the power system because the MPP tracking of the inverter no longer controls the operating of the PV panels
3. Omnik assumes no responsibility for compliance to EMC regulations for the complete system
4. Tigo Energy has approved the operation of its products with Omnik products
