CoverLawn is unique. It is an open synthetic turf, with no backing. Via a knitting technique, the synthetic fibres create a braid of knots, and when stretched, these braids form a honeycomb of holes. These holes allow the natural grass to grow through, and the fibres protect the grass from damage.

1. Measure and mark out the area you wish to cover with CoverLawn. Allow for the CoverLawn to be pushed into the soil by 10mm around the edge of the area.

2. If you are installing over an existing grass area then remove weeds and foreign grasses (Photo1). Mow the surface as low as possible, 20 mm is ideal or otherwise put the mower on lowest level.

3. Or: Install new sod in the area as required. For information on installing new sod go to **www.hgturfgroup.com.au**.

4. CoverLawn will align itself with the natural contours of the ground. If the surface is uneven then top dress the area 50/50 sand soil mix.

5. Roll out the CoverLawn over the area.
Cut to size with a good pair of scissors. (Photo 2).

6. Cut into the edge of the area with a spade or bed knife. Push the CoverLawn into the soil to secure it. (Photo 3). Start from middle and work towards the ends. Make sure you have good stretch/tension on the CoverLawn. Work down one side first then stretch it on the other side.

7. Use a hammer and Biodegradable pegs to anchor the edges and secure it in place. Place pegs in the centre of the area at 5m intervals. (Photo 4)

8. If you are joining 2 pieces of CoverLawn this can be done by either cable tying / or stitching the material together or just push both pieces into the soil side by side. (Photo 3).

9. Top dress the final area with sand and water it in to fill in the CoverLawn.

10. As the grass grows through the CoverLawn you can continue with normal lawn maintenance. Avoid very low mowing, It is best to keep you grass a little longer to help with the high traffic.

See right.
