Market Review

Equity markets continued to fall over the third quarter of 2022 with the S&P 500 Index down 4.88% for the period. Growth stocks fared better than value stocks, while small-caps outperformed large-caps over the third quarter. Domestic equities outperformed foreign stocks, particularly emerging markets. China continued to drag performance, as its zero-Covid lockdowns have hindered economic activity.

Within fixed income, short-duration bonds held up much better than their longer-duration counterparts, as yields spiked over the third quarter. Bank loans were among the best performing asset class, due to their floating rate adjustment feature.

Fund Performance

The fund returned -4.08% during the third quarter of 2022 and -17.11% for the trailing 12-month period (Class A at NAV).

Performance Review

The domestic equity group lagged the S&P 500 Index in the third quarter and the 12-month period. Over the trailing 12-month period, our large-cap value exposure contributed to performance, while our allocation to small-caps was a larger detractor to performance. Furthermore, PF Multi-Asset detracted from performance for both periods.

International equities as a group underperformed the MSCI EAFE Index over the third quarter and the trailing 12-months. Our exposure to emerging markets hurt performance over the third quarter and the trailing 12-months. Additionally, PF Emerging Markets considerably underperformed its benchmark over the trailing 12-month, although it has improved over the third quarter. Furthermore, PF International Small-Cap outperformed its benchmark over the trailing 12-month period, which helped offset the detractors.

The broad fixed-income lineup outperformed the Bloomberg US Aggregate Bond Index over the third quarter and the trailing 12-months. Our overweight to short duration bonds and bank loans were strong contributors to performance for the quarter and over the trailing 12-months. However, underperformance from PF Managed Bond detracted from performance for the quarter and the trailing 12-months. The exposure to emerging market bonds held back performance, but the outperformance of PF Emerging Markets Debt helped performance over the trailing 12-months.

Outlook

Taming inflation continues to remain the Federal Reserve's priority as the central bank has been aggressively raising rates after failing to address inflationary pressures earlier. Although we may have reached peak inflation, slowing it down has been a difficult task for the Fed and other central banks. High inflation has been a global phenomenon that's weighing on consumer sentiment and growth.

Most global central banks have joined the Fed in a fight against inflation, which has had rippling effects through financial markets and the global economy. The recent era of cheap liquidity, which lasted through the worst of the pandemic, looks to be coming to an end. Now, higher borrowing costs will likely dampen investments, hiring and consumption.

The housing market has been particularly vulnerable to the aggressive rate hikes, although the limited supply of homes may prevent housing prices from coming down too much. Higher interest rates have led to higher mortgage rates, which have hammered home sales. Although the housing market may seem to be in a recession, the overall U.S. economy should be able to avoid a sharp slowdown because of relatively healthy corporate balance sheets. One caveat could be if the Fed hikes interest

Past Performance is not indicative of future results. Returns reflect reinvestment of dividends/distribution. Investment return and principal value will fluctuate so that an investor's shares, when redeemed, may be worth more or less than their original cost. Net/Gross annual operating expenses for Class A are 1.29% and 1.22%.

rates even more aggressively than expected. This could happen if inflation doesn't come down quickly enough or there is a shock stemming from more geopolitical upheaval.

The war in Ukraine has had a significant impact on inflation, particularly food and energy. Europe is particularly vulnerable to a prolonged war in Ukraine as it had depended on Russian gas. Russia's latest escalation in the war further complicates the market outlook. Russian President Vladimir Putin has ordered the mobilization of approximately 300,000 more troops and warned of nuclear force to any threat to Russia's territory.

Despite the global challenges, U.S. consumer spending had been resilient earlier this year, supported by savings. However, those savings from government aid have dwindled as consumers racked up credit card debt. Credit card debt in the U.S. has surged over the past year as high inflation dug into savings.

Furthermore, interest rates on credit cards have risen as the Fed tightened monetary policy. This environment has been particularly challenging for those who live paycheck to paycheck and spend most of their earnings on necessities such as housing, food, and gas.

So far, companies have maintained solid profit margins despite paying more for labor and input costs. This is because

corporations have benefited from robust revenue growth due to unusually high pricing power. This situation may change as consumers temper their spending. As a result, companies will likely pare back hiring and capital spending. Employment conditions have been leveling off as hours worked for manufacturing jobs have started to fall. The Fed anticipates unemployment rate will rise to roughly 4.4% next year. Furthermore, higher borrowing costs will likely discourage investments into new equipment and factories.

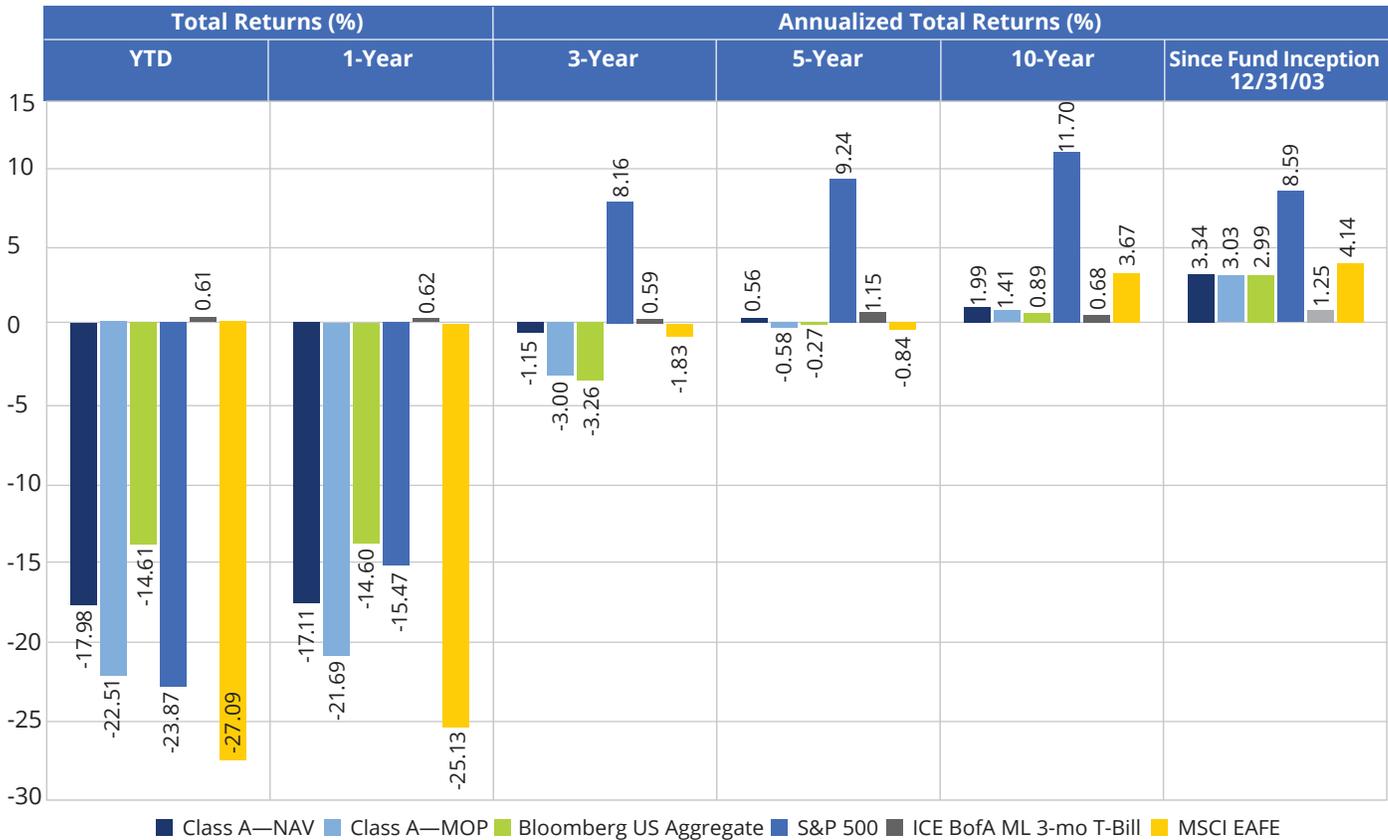

The market expects Fed Chair Jerome Powell and other voting members to opt for another 75-basis-point hike in November, followed by another 50-basis-point hike by yearend. Furthermore, the Fed anticipates that it will continue raising rates into 2023. This means that the likelihood of a soft landing for the economy will diminish with each additional rate hike.

To date, the Fed has opted for forceful and rapid steps to moderate demand to align with supply. A year ago, the median expectation for the fed funds rate was below 1% by the end of 2022. Now, the fed funds rate is expected to surpass 4% by the yearend. The Fed made the mistake of reacting to a booming economy too late. Hopefully, they don't make another one on the other end by tightening too much, too late.

Definitions

The **Bloomberg US Aggregate Bond Index** is composed of investment-grade U.S. government and corporate bonds, mortgage pass-through securities, and asset-backed securities and is commonly used to track the performance of U.S. investment-grade bonds.

The **MSCI EAFE Index** is designed to measure the equity-market performance of developed markets in Europe, Australasia, and the Far East.

The **S&P 500 Index** is a market capitalization-weighted index of 500 widely held stocks often used as a proxy for the U.S. stock market.

Investing involves risk. Principal loss is possible. Asset allocation and diversification do not guarantee future results, ensure a profit or protect against loss. Although diversification among asset classes can help reduce volatility over the long term, this assumes that asset classes do not move in tandem and that positive returns in one or more asset classes will help offset negative returns in other asset classes. There is a risk that you could achieve better returns by investing in an individual fund or multiple funds representing a single asset class rather than using asset allocation. A fund-of-funds does not guarantee gains, may incur losses and/or experience volatility, particularly during periods of broad market declines, and is subject to its own expenses along with the expenses of the underlying funds. It is typically exposed to the same risks as the underlying funds in which it invests in proportion to their allocations.

Investors should consider a fund's investment goal, risk, charges, and expenses carefully before investing. The prospectus contains this and other information about the fund and can be obtained at www.PacificFunds.com. It should be read carefully before investing.
