## Community Health Status Assessment

MAPP (Mobilizing for Action through Planning and Partnerships) is a community-wide strategic planning process for improving public health, as well as an action oriented process to help communities prioritize public health issues, identify resources for addressing them, and taking action. MAPP provides a framework, guidance, structure, and best practices for developing healthy communities. Black Hawk County Health Department, in collaboration with community stakeholders, is using the MAPP process to develop a community health assessment and community health improvement plan. This process was initiated in March of 2019 when representatives from the National Association of County \& City Health Officials (NACCHO) led community stakeholders through a training and visioning process for Black Hawk County (BHC). The community health assessment is comprised of four assessments to understand the health issues and needs of the community.

The Community Health Status Assessment (CHSA) collects quantitative information on health status, quality of life, and risk factors. It is the only assessment of the 4 MAPP assessments that is purely quantitative. The health indicators listed in this CHSA will help decide the priorities for the Community Health Assessment (CHA) and the Community Health Improvement Plan (CHIP). The CHSA was created in order to answer two questions:

1. "How healthy are Black Hawk County residents?"
2. "What does the health status of Black Hawk County look like?"

## Method

The data presented in this report was gathered from multiple sources. Some data in this report was obtained through a Data Sharing Agreement with the lowa Department of Public Health (IDPH). This includes births, mortalities, Behavioral Risk Factor Surveillance System (BRFSS), and inpatient/outpatient primary diagnoses. Publically available data sources were used, including the U.S. Census Bureau, IDPH tracking portal, Iowa Secretary of State, County Health Rankings, Iowa Youth Survey, CDC Wonder, Iowa Department of Education, lowa Department of Transportation, lowa State University, and the CDC 500 Cities Project.

Demographic trend comparisons used local, state, and federal data to compare different health indicators. The goal was to demonstrate how Black Hawk County compared to the rest of lowa and the United States. County level data is available in table format to show trends in Black Hawk County over time. While some indicators have state and local level data, this section is focused on the local level. The main objective for this section is to show how the local level is progressing or regressing in various health outcomes through the years.

Population growth is starting to decline

Population below federal poverty level is higher than the Iowa average and United States average.

Mortality trends of motor vehicle and all transportation deaths are much lower than Iowa average

Cases of child abuse/neglect higher in Black Hawk County than in Iowa

Figure 4. Chlamydia - Rates of Reported Cases by County, United States, 2018

Black Hawk County placed in the worst category for STD rates in the United States

Uninsured population in lowa is one of the lowest in the country.

Cancer rates for breast cancer are relatively high compared to the rest of the United States.

Asthma hospitlaization rates much higher in Black Hawk County than the rest of lowa for children under age 5 years.

## County Health Rankings \& Roadmaps

The County Health Rankings \& Roadmaps program is a partnership between the Robert Wood Johnson Foundation, a non-profit philanthropy that focuses its efforts on pressing health issues, and the University of Wisconsin Population Health Institute. The County Health Rankings project uses nationwide, statewide, and local data to create a ranking list that compares health outcomes between populations. The health outcomes analyzed include length of life, quality of life, health behaviors, clinical care, social and economic factors, and physical environment.

The annual health ranking snapshot of Black Hawk County is beneficial to health professionals and is used to compare our county to other counties in lowa. With this information we can better understand the health needs of Black Hawk County and plan interventions to promote a healthier community. Data displayed in the County Health Rankings were released for 2019, which includes date ranges from 2010 to 2018. The table below displays Black Hawk County's health outcome, lowa's average health outcome, Black Hawk County's ranking (out of 99 counties, with 1 being the best and 99 the worst), year range the data was obtained, and a description of the health outcome.

Black Hawk County's overall rank is $61^{\text {st }}$ of 99 counties. This is worse than the previous year's ranking of $58^{\text {th }}$ of 99 counties. The health outcomes that are worse in 2019 than in 2018 are length of life and quality of life. All other health outcomes (health behaviors $72^{\text {nd }}$, clinical care $18^{\text {th }}$, social and economic factors $89^{\text {th }}$, and physical environment $72^{\text {nd }}$ ) are ranked better in 2019 than in 2018.

| County | 2019 County Health Ranking, lowa: Black Hawk County = 61 |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Black Hawk | Iowa | County Ranking | Year of Data | Description |

Wisconsin Population Health Institute. https://www.countyhealthrankings.org/

## Demographics

## Population Trends

BHC, lowa was founded in 1843 with a total land area of 573 square miles. It is the fourth-most populated county in the state of lowa. As of the 2010 census, the population in BHC is 131,090 , and a 2018 population estimate of 132,408 . The population estimates through 2018 depict a fluctuation, but the population is increasing. BHC's population growth rate has varied over the years, but has an average growth rate of $0.14 \%$. This is smaller than the lowa average growth rate of $0.44 \%$.

Figure 2 compares the change in population of BHC to the State of lowa. BHC's racial distribution shows that, in general, the population is becoming more diverse. White non-Hispanic or Latino percentages are decreasing, while all other racial and ethnic groups are increasing.

Recent census estimates show that the age distribution is slowly changing. There has been a decrease in the younger population, while the older population is increasing. BHC has a much higher population of individuals age 20 to 24 than the state and federal average, which may be due to student attendance to local universities. In the past, BHC had a much lower proportion of individuals age 35 to 54 compared to the state and federal average, however, the proportion in this age group has been increasing from 2015 to 2018. The gender distribution in BHC is almost $50 \%$ male and $50 \%$ female.

Figure 1. Population estimates from 2010 census. ${ }^{1}$

Figure 2. Population change for Black Hawk County by race and ethnicity. ${ }^{1}$

Figure 3. Comparison of age categories in Black Hawk County for years 2015 and 2018. ${ }^{1}$

Figure 4. Comparison of age categories by local, state and federal level for 2018. ${ }^{1}$

## Immigrant Distribution

According to the American Immigration Council, nearly 5\% of lowa's population was born in another country and over $4 \%$ of residents are native-born Americans who have at least one immigrant parent in 2017. ${ }^{15}$ The top countries of origin for immigrants were Mexico (29.3\%), China (7.7\%), India (7.1\%), Vietnam (4.5\%), and Bosnia and Herzegovina (3.3\%). In BHC, 5\% of the population is foreign born. This includes Europe (34.3\%), Asia (29.6\%), Africa (10.8\%), and the Americas (23.5\%).

From 2010 to 2014 26\% of the immigrant population (1.3\% of lowa population) were undocumented immigrants. As of 2015, 37.4\% of the immigrants in lowa were naturalized. The total immigrant-led households in lowa paid $\$ 348.9$ million in state and local taxes in 2014. It was estimated that undocumented immigrants paid $\$ 36.7$ million in state and local taxes in 2014.

## Socioeconomic Status

The Median Household Income (MHI) for BHC is only $88.3 \%$ of the lowa average, and $86.2 \%$ of the United States average (BHC = $\$ 50,916$, lowa $=\$ 58,570$, US $=\$ 60,336$ ). The MHI has increased at the local, state, and federal level over the years, even after adjusting for inflation. BHC has more households that make $\$ 0$ to $\$ 49,999$ than state or federal averages. In 2017, the federal poverty level was $\$ 12,060$ for a household with 1 individual, $\$ 12,240$ for 2 people, and $\$ 20,420$ for a household of 3 . This puts the MHI groups of $\$ 0-\$ 24,000$ at risk of falling below the federal poverty level. Census data suggests that BHC has an increasing population that falls below the poverty level, and has a higher percentage below the federal poverty level than the state and federal averages.

Unemployment rates across the United States have been decreasing since 2010, and have dropped to less than $5 \%$ by the end of 2018. Although this drop has also occurred in BHC, we are still much higher than the state average. In 2017, the lowa average for unemployment rate was only $67.9 \%$ of BHC's (BHC $=5.3 \%$, lowa $=3.6 \%$ ). BHC's unemployment rate and housing tenure is similar to the United States average, so the difference between lowa and BHC could be due to other geographic and demographic factors. One explanation is the large cities within BHC and local universities in Cedar Falls and Waterloo. However, according to the U.S. Department of Agriculture, rural unemployment rates are higher than urban ${ }^{2}$. A comparison between other lowa counties and BHC is a potential health indicator to look at in future assessments.

Housing Tenure 2017

Figure 11. Comparison of population proportions at the local, state, and federal levels in 2017. Owned properties include homes with and without a mortgage. ${ }^{1}$

## Health Insurance Trends

Lack of health coverage has been a growing problem in the United States. It affects a person's medical decisions, and has been associated with overall health. ${ }^{4}$ In 2010, the date that the Affordable Care Act came into effect, there were 46.5 million uninsured Americans under age $65 .{ }^{4}$ This number dropped to about 27 million by 2016. ${ }^{4}$ Recent trends show that the uninsured population is no longer decreasing. From 2016 to 2018 there has been an increase in the uninsured by 1.2 million. ${ }^{4}$ Data collected on the uninsured population showed that barriers to obtaining health care coverage affect some population groups more than others. The majority of individuals without insurance are low-income adults and people of color, and most claim they are unable to afford the insurance rates. ${ }^{4}$

The average percentage of uninsured Iowans was only 54\% of the United States average (lowa = 4.7\%, US $=8.7 \%$ ). In 2018, lowa was one of 9 States (10 states including Washington D.C.) that had less than $7 \%$ uninsured Americans below 65 years of age. ${ }^{5}$ BHC has a slightly higher percentage of uninsured compared to the lowa average, but is still much lower than the United States average. In lowa, Black or African American populations have a higher percentage of uninsured compared to the White or Caucasian population.

Figure 12. Proportion of population below age 65 that did not have insurance coverage within the last year in 2017. ${ }^{1}$

Figure 13. Proportion of population below age 65 broken down by race that did not have insurance coverage within the last year in 2017. ${ }^{1}$

Figure 14. Map of population proportions below age 65 that did not have insurance coverage within the last year in $2018 .{ }^{5}$

## Education Trends

Educational attainment has been associated with unemployment rate, income, and at some level health. ${ }^{6,7}$ Figure 20 depicts the association of education to economic factors. Although the correlation is not completely understood between education and health outcomes, studies have shown that increasing education also increases health. ${ }^{7}$

State and local populations have a higher percentage of individuals with some college (no degree) or an Associate's degree. The federal average that attained Bachelor's degrees or post undergraduate is larger than local levels. One explanation could be that the large proportion of university students fall within the "some college (no degree)" and "Associate's degree", but have not attained a Bachelor's degree. BHC has a higher percentage of individuals age 25 and older that have not attained a High School diploma. The association between education and health can be further looked at within BHC in future assessments.

The graduation rates of BHC public schools are similar to each other with an average graduation rate of $92.3 \%$ in 2018. The Waterloo school district graduation rates are about $10 \%$ lower than the other school districts (Waterloo $=84.2 \%$, Union $=90.4 \%$, Hudson $=97.7 \%$, Dunkerton $=92.3 \%$, and Cedar Falls $=$ $96.8 \%$ in 2018). This rate has been increasing in recent years from $80 \%$ to $84 \%$. The 4 year trend shows

Cedar Falls, Hudson, and Waterloo school districts have increasing high school graduation rates, while Union and Dunkerton school districts have decreasing high school graduation rates.

Figure 16. Calculated averages of educational attainment by unemployment rate and median weekly earnings in the United States in $2018 .{ }^{6}$

Figure 17. Graduation rates of BHC public school districts for graduation years 2015 to $2018 .{ }^{8}$ It should be noted that Union also includes students that live in Tama County.

## Iowa Youth Survey

The lowa Youth Survey (IYS) gathers information on students in grades 6, 8, and 11 on topics such as behaviors, perceptions, and environment. There have been 6 to 11 different school districts that participate in the IYS, with the most recent year representing 9 school districts. The objectives of the IYS are to identify youth developmental needs and implement targeted interventions to help lowa students.

The IYS found that there has been a decrease in the percentage of students indicating binge drinking and cigarette use. From 2012 to 2018, BHC's percentages have decreased by $53.7 \%$ for binge drinking ( $8.2 \%$ to $3.8 \%$ ) and $72.5 \%$ for cigarette use ( $5.1 \%$ to $1.4 \%$ ). All participating schools in lowa had an average decrease of $36.3 \%$ for binge drinking ( $8 \%$ to $5.1 \%$ ) and $57.1 \%$ for cigarette use ( $4.9 \%$ to $2.1 \%$ ). Cigarette use did not previously include vaping, but for years 2016 and 2018 a question was added that asks if students smoked vape or e-cigarettes. In 2016, 5\% of the students indicated they vaped within 30 days $\left(6^{\text {th }}\right.$ grade $=1 \%, 8^{\text {th }}$ grade $=5 \%, 11^{\text {th }}$ grade $\left.=10 \%\right)$. In $2018,9 \%$ of the students indicated they vaped within 30 days ( $6^{\text {th }}$ grade $=2 \%, 8^{\text {th }}$ grade $=7 \%, 11^{\text {th }}$ grade $=20 \%$ ).

Bullying in school for BHC is similar to the lowa average with trends maintaining around 40\%. Students across lowa have indicated that they feel less safe in schools in recent years. In 2018, BHC students felt much safer than the lowa average. There is a high percentage of students that indicated they felt hopeless or had serious suicidal intentions. The population most affected is $11^{\text {th }}$ grade females, but female students in all grades were higher than male students. There was also an increase of suicide plans of students. Since 2012, lowa students that had a suicide plan within the last year increased by $53 \%$ (6.6\% to 10.1\%) and BHC has increased by 25.4\% (6.7\% to 8.4\%).

## Environmental Health

The population in lowa using public water supply has increased in the last 4 years. There has been in increase of over 60,000 residents that use public water supply instead of private well water. Moving from a private well to a public water supply may help regulate water contamination. Contamination can occur through natural sources like radon, arsenic, uranium, manganese and nitrate, or the presence of bacteria. Contamination can cause gastrointestinal disease or other adverse health outcomes if not properly treated. Although city water is not completely free of contaminants, there are water treatment methods to reduce bacteria and carcinogens that can cause illness.

Recent trends show that almost 1/3 of private wells tested for coliform bacteria are positive. In BHC over $40 \%$ of the wells tested in 2015 and 2016 were positive for coliform bacteria. The wells tested for nitrate show a decreasing trend for positive results. In 2018, less than $15 \%$ of the wells tested for nitrate were positive.

Lead exposure is another hazardous environmental factor that is occurring in BHC. The risk of developing lead poisoning or elevated blood lead levels is associated with multiple risk factors common in Waterloo and Cedar Falls. This includes houses built before 1949 and children in families with income below the federal poverty level. The map of BHC illustrates the highest risk areas for homes built earlier
than 1949, with a majority in Waterloo. Throughout the county there is a high lead risk for children under the age of 5 that belong to families earning below the federal poverty level. Western Waterloo has census blocks in both categories of high lead risk and is an area of concern.

Figure 26. Count of Iowans that use a public water system for a portion of their water needs. ${ }^{10}$

## Maternal Child Health

Birth rates in lowa have been decreasing since 2010. BHC's birth rates have fluctuated each year but have been higher than the lowa average for every year beside 2011. Birth rates from mothers under age 20 are similar between lowa and BHC, and have decreased. The age of birth mothers is increasing in lowa and BHC. The average age increased a little over 1 year from 2010 to 2018, but BHC's mothers on average are $1 / 3$ year younger than the state average. This trend is also clear at the federal level. The CDC attributes the increase in average age to fewer teens having babies. BHC had a higher proportion of singleton births that were low birth rate compared to lowa.

## Live Births per 1000 Population

Figure 31. Trend comparison between lowa and Black Hawk County. Live birth rates include first time mothers of all ages. Rates calculated per 1000 population. ${ }^{10}$

Figure 33. 2014 maternal age trends across the United States. ${ }^{11}$

Figure 34. Average maternal age comparison between lowa and Black Hawk County. Mothers were defined as the first name on the birth certificate. Mothers that did not birth the child were excluded. ${ }^{10}$

## Low Birth Weight Singleton Full Term Births

Figure 35. Trend comparison between lowa and Black Hawk County of low birth weight singleton births. ${ }^{10}$

## Injury and Mortality

BHC has lower 5 year age-adjusted mortality rates for transportation, poison, and fall mortality compared to lowa. Further, motor vehicle traffic and all transportation mortality is much lower than the lowa average. In BHC, less than 1\% of the motor vehicle accidents result in fatality with $52.6 \%$ occurring in Waterloo and $15.8 \%$ in Cedar Falls.

BHC has a higher homicide and all other unintentional mortality rate compared to lowa. This is potentially due to the presence of large cities in BHC. To further investigate the homicide rate, we compared BHC to Linn County and Johnson County. However, Johnson County's rate was suppressed due to their lower rates. Although Linn County has demographic and population differences compared to Black Hawk, it offers a reference point to compare BHC to other counties in lowa. Linn County's homicide rate is only 3.5 per 100,000 compared to BHC's 4.2 per 100,000. This shows us that there might still be an underlying factor contributing to the higher rate of homicide. The United States homicide rate is 2.2 X higher than $B H C$ 's $(B H C=4.2, U S=9.2)$, so $B H C$ 's rate is low relative to other areas in the United States.

The suicide rate in Iowa and BHC is higher than The United States average. The United States average for suicides is 13.2 per 100,000 population, which is lower than lowa and BHC rates (lowa = 13.8 per 100k, $B H C=14$ per 100k).

## 5 Year Mortality Age-Adjusted Rate per 100k Population (2013-2017)

Figure 36. 2013-2017 Five year mortality rates of lowa and BHC. All age groups were included in analysis and were age adjusted. Rates calculated per 100,000 population. ${ }^{15}$

## Chronic Disease

Chronic diseases account for 7 of the 10 top leading causes of death in the United States. The top 2 leading causes of death are heart disease and cancer. According to the American Cancer Society (2019), they expect almost 6,500 lowans to die of cancer in 2019. ${ }^{12}$ The American Heart Association recently published an article for cardiovascular disease. They found that the cardiovascular disease death rate for Iowa was 213.5 per 100,000 population for $2013-2015 .{ }^{13}$ This is $22.4 \%$ lower than the rate in 2003-2005 (275.1 per 100,000). The average cardiovascular disease death rate in the United States has decreased by $25.5 \%$ since 2003-2005 to 2013-2015 (297.9 to 221.9). ${ }^{13}$

The 5-year cancer incidence for 2012-2016 is similar between BHC and the lowa average. BHC has a lower incidence rate for colorectal cancer and thyroid cancer, but a higher breast cancer incidence rate and lung cancer rate compared to the lowa average. The United States incidence rates for 2011-2015 were 124.7, which is lower than the BHC rate of 140.1. ${ }^{10}$

COPD hospitalization trends for lowa and BHC are decreasing for every age group excluding 45-64 years. Although the lowa average appears to be decreasing since 2015, BHC's rates for this group are increasing. The COPD rates in BHC have been far lower than the lowa average. The asthma hospitalization rates for the children under the age of 5 is much higher in BHC than the rest of lowa. In 2018, the lowa average was only $58.0 \%$ of $B H C$ 's ( $B H C=143.4$, lowa $=83.2$ ).

## 5 Year Cancer Incidence 2012-2016

Figure 37. 2012-2016 Five year cancer incidence of lowa and BHC. All age groups were included in analysis and were age adjusted. Female breast cancer was further broken down by age to show differences in rates. Rates calculated per 100,000 population. ${ }^{10}$

## Communicable Disease

Combined cases of syphilis, chlamydia, and gonorrhea are increasing in the United States. In 2018, these sexually transmitted infections (STIs) reached an all-time high. ${ }^{11}$ Medical treatment can cure these STIs, but they can cause health problems if left untreated including miscarriage, stillbirth, and newborn death. The CDC suggests that the rates are increasing due to multiple factors, including access to STI prevention and care, decreased condom use in vulnerable populations, and STI program cuts.

There has been a steady increase in STI rates in BHC and the rest of lowa. BHC has had higher Chlamydia and Gonorrhea rates than the rest of lowa. In 2018, lowa ranked as one of the better states for average STI rate, but BHC had similar rates to the bottom ranking states. Although BHC does not have the worst rate in the United States, the CDC has classified it with the worst ranking counties.

Enteric diseases in BHC have been lower than the lowa average for most years between 2006 and 2018. Both trends appear to be increasing since 2006, but the lowa average is increasing at a faster rate than BHC. In 2018, BHC's rate for all enteric diseases was only $67.1 \%$ of lowa's ( $B H C=38.45$, lowa $=57.28$ ). The sporadic trend of enteric diseases can be explained by clustered outbreaks. In 2015, BHC had an outbreak of diarrhea in a school, which explains why the BHC rate is higher than lowa's for that year.

Figure 43. Sexually transmitted infection rates across the United States. Rates calculated per 100,000 population. ${ }^{11}$

Figure 47. Enteric disease rates for lowa and BHC. Rates calculated per 100,000 population. ${ }^{10}$

## Inpatient / Outpatient

Inpatient and Outpatient records were obtained from IDPH for discharge dates 1/1/2013 through $12 / 31 / 2017$. The data query was based on principal diagnosis of the following diagnoses, mental disorders, acute myocardial infarction, heart failure, asthma, cerebrovascular diseases, and accidental falls. The ICD-9 codes were all mental health diagnoses, acute myocardial infarction, heart failure, cerebrovascular diseases (excludes transient cerebral ischemia), asthma, accidental falls, and injuries due to war by other forms of unconventional warfare. Additional ICD-9 codes were obtained for outpatient records including, oral diseases and damaged teeth. These codes represent falls and oral health. Comorbidity data was also collected for each primary diagnosis, but is not included in this report.

## Inpatient

The analysis of inpatients diagnosed with asthma showed that patients were $59 \%$ female and $41 \%$ male. The average age was 25.9 years with a range of patients age 1 to 87 . Children under the age of 5 made up 29.4\% of the asthma patient population. The patients needing to go to the emergency room was $75 \%$. The racial composition of these patients was $49 \%$ White, $43 \%$ Black, and $8 \%$ all other races combined.

Mental disorders made up the majority of data requested for inpatient hospitalizations. This was due to the emphasis on understanding mental health care and treatment in our community. The breakdown of patients diagnosed with mental health disorders by race showed that $82.5 \%$ were White, $14.6 \%$ were Black or African American, and 2.9\% were all other races combined. The patients were $45.7 \%$ female and
54.3\% male. The average age of a mental disorder patient was 37.8 years, with an age range of 5 to 91 . Of patients hospitalized for a mental health disorder $79.1 \%$ were admitted through the emergency room. A majority of patients were diagnosed with mood [affective] disorders (51.0\%) or mental and behavioral disorders due to psychoactive substance use (24.2\%).

Patients that were diagnosed with heart failure had an average age of 73 years old. The sex distribution was $53.1 \%$ female and $46.9 \%$ male. A majority of the patients were White (85.9\%). A large portion ( $84.0 \%$ ) of the patients presented to the emergency room for their diagnosis. Patients that were diagnosed with acute myocardial infarction had an average age of 68 years. The sex distribution was $39.5 \%$ female and $60.5 \%$ male. A majority of the patients were White (87.9\%). A large portion (90.6\%) of the patients went to the emergency room for their diagnosis.

Patients that were diagnosed with cerebrovascular disease had an average age of 73 years old. The sex distribution was $45.9 \%$ female and $54.1 \%$ male. A majority of the patients were White (83.5\%). A large portion (68.1\%) of the patients presented to the emergency room for their diagnosis.

## Outpatient

The analysis of outpatients diagnosed with Asthma showed that patients were $56.2 \%$ female and $43.8 \%$ male. The average age was 36.2 years with a range of patients age 0 to 105 . Children under the age of 5 made up $8.9 \%$ of the Asthma patient population. Of outpatient visits for asthma, $50.1 \%$ were at an emergency room. The race composition of these patients was $60.3 \%$ White, $34.7 \%$ Black, and $4.9 \%$ all other races combined.

The breakdown of total mental health disorders by race showed that $82.1 \%$ were White, $12.9 \%$ were Black, and $5.0 \%$ were all other races combined. The patients were $48.7 \%$ female and $51.3 \%$ male. The average age of a mental disorder patient was 36 years, with an age range of 0 to 105 . The patients needing to go to the emergency room was 72.3\%. A largest proportion of patients were diagnosed with mood [affective] disorders (28.0\%), and the next largest was pervasive and specific developmental disorders (20.3\%).

Patients that were diagnosed with heart failure had an average age of 70.5 years old. The sex distribution was $47.2 \%$ female and $52.8 \%$ male. A majority of the patients were White ( $86.7 \%$ ). A small portion (12.8\%) of the patients went to the emergency room for their diagnosis. Patients that were diagnosed with acute myocardial infarction had an average age of 64.4 years. The sex distribution was $26.9 \%$ female and $73.1 \%$ male. A majority of the patients were White ( $87.4 \%$ were White, other race categories were too small to include without violating the data sharing agreement). A small portion (12.0\%) of the patients went to the emergency room for their diagnosis.

Patients that were diagnosed with cerebrovascular disease had an average age of 66.5 years old. The sex distribution was $55.5 \%$ female and $44.5 \%$ male. A majority of the patients were White ( $88.7 \%$, other race categories were too small to include without violating the data sharing agreement). A small portion (5.4\%) of the patients went to the emergency room for their diagnosis.

Figure 48. An online trail use survey was developed as part of the 2014 Waterloo/Cedar Falls Metropolitan Area Trail Count. The survey was open from June $15^{\text {th }}$ through June 26 (2014) and consisted of 22 questions. The purpose of the survey was to determine the demographic make-up of trail users. A total of 205 surveys were submitted.
http://www.inrcog.org/pdf/2014 Trail Count Summary Report.pdf

## Iowa Kids Count

lowa Kids Count looked at BHC indicators and outcomes that are associated to Adverse Childhood Experiences (ACEs). ACEs are potentially traumatic events that occur in childhood ( $0-17$ years). They are common in the United States population with $61 \%$ of adults reporting that they had experienced at least 1 type of ACE. According to the 2016 ACEs Report, $14.5 \%$ of lowa adults report experiencing four or more ACEs. The report went on to show that $12.9 \%$ of BHC residents had four or more ACEs. ACEs have been found to have a large impact on future health, violence victimization, mental illness, substance misuse, and health opportunities. The data displayed in this section does not indicate the level of ACEs in the community, but are outcomes associated with ACEs.

According to the CDC, 1.9 million cases of heart disease and 21 million cases of depression could have been avoided if ACEs were prevented. Further, ACEs have been found to have a graded dose-response relationship with obesity, diabetes, STDs, cancer, smoking, alcoholism, and COPD. These could have been prevented by connecting youth to caring adults, strengthening economic supports for families, and ensuring a strong start for children.

The data displayed in the table shows the change from 2000 to 2017 for BHC and lowa. Some data overlaps with the Census and BRFSS, but the Child and Family Policy Center focuses on indicators that affect children. These trends will help determine targeted interventions to help the children within BHC.

Black Hawk County Immunization Recommendations

| Indicator | Unit | Year |  | Source |
| :---: | :---: | :---: | :---: | :---: |
|  |  | 2 Year Old | Adolescent |  |
| Immunization Series Completed | Percentage | 84.5\% | 85.2\% | IDPH |
| Fulfilled DTP/DTaP or Td/Tdap Recommendation | Percentage | 89.8\% | 90.4\% | IDPH |
| Fulfilled Polio Recommendation | Percentage | 95.3\% |  | IDPH |
| Fulfilled Haemophilus influenzaetype B Recommendation | Percentage | 92.3\% |  | IDPH |
| Fulfilled Pneumococcal Recommendation | Percentage | 88.2\% | . | IDPH |
| Fulfilled Hepatitis B Recommendation | Percentage | 95.9\% | 98.9\% | IDPH |
| Fulfilled MMR Recommendation | Percentage | 91.8\% | 95.9\% | IDPH |
| Fulfilled Varicella Recommendation | Percentage | 91.0\% | 93.4\% | IDPH |
| Fulfilled Meningococcal Recommendation | Percentage |  | 79.3\% | IDPH |
| Immunization Series Completed by Race |  |  |  |  |
| White | Percentage | 86.6\% | 88.0\% | IDPH |
| Black or African American | Percentage | 77.4\% | 80.3\% | IDPH |
| Other Race | Percentage | 83.1\% | 79.4\% | IDPH |
| Immunization Series Completed by City |  |  |  |  |
| Waterloo | Percentage | 82.9\% | 83.2\% | IDPH |
| Cedar Falls | Percentage | 86.2\% | 87.9\% | IDPH |
| Evansdale | Percentage | 84.6\% | 80.0\% | IDPH |

*Immunization data was obtained for the 2018 school year. 2 Year olds were defined as children with birthdates ranging from $01 / 01 / 2015$ through $12 / 31 / 2015$. Adolescents were defined as children with birthdates ranging from 01/01/2002 through 12/13/2004.

The children age 2 vaccination recommendations are to have at least 4 DTP/DTaP, 3 Polio, 1 MMR, 3 Haemophilus influenzaetype B, 3 Hepatitis B, 1 Varicella, and 4 Pneumococcal vaccines to be classified as a complete series.

The adolescent vaccination recommendations are to have at least 3 Hepatitis $B, 2 M M R, 2$ Varicella, 1 Td/Tdap at age 10, 1 Meningococcal at age 10 and 1 at age 16 to be classified as a complete series.

This data is based on the number of doses of each vaccine received, and does not account for the validity of doses due to minimum spacing between doses, or children on the catch-up immunization schedule. The Meningococcal vaccine fulfillment for adolescents is likely to increase over the next several years as lowa implemented a school requirement starting in the 2017-2018 school year, and only a small fraction of the adolescents included in the data obtained would have been required to obtain the Meningococcal vaccine.

## The CDC's Behavioral Risk Factor Surveillance System

The Behavioral Risk Factor Surveillance System (BRFSS) is a nationwide surveillance tool that aims to understand and measure the behaviors associated with adverse health outcomes within different populations. This information is then used as a tool to target specific behaviors that affect health. BRFSS completes more than 400,000 adult interviews each year, making it the largest continuously conducted health survey system in the world.

The data presented in this health status assessment is limited to the BHC participants of the BRFSS. The demographic distribution of the BHC participants were similar to the census distributions. However, there was a higher proportion of White, non-Hispanic participants represented than the demographic makeup within BHC. Our intention was to deliver the BRFSS data by racial ethnic groups, but there was a limited number of participants from Black Hawk County that took the survey. We were unable to break down the data by racial ethnic groups without running the risk of revealing identifiable information.

BHC data was obtained for the years 2012 through 2017. We received a total of 70 interview questions, and 43 of the 70 questions were used in analysis. The questions that were excluded were demographic information and questions that contained less than 2 years of data. The questions that were not asked in a given year are labeled with a "." and the suppressed data is marked by the symbol "**". Overall totals at the end of this section were obtained by combining all years of data (2011-2017). This made the proportion of Black or African American population large enough to analyze separate from the White population.

*Overall data only included date ranges of 2011-2017 due to small population sizes. We were only able to break down by race for the White population and Black/African American due to too small of population sizes in other races. This occurred even when combining all other races groups into one. Data displayed in the table were the only indicators that had ample population sizes to analyze.

## 500 Cities Project

The 500 Cities Project is a collaborative project between the CDC Foundation and The Robert Wood Johnson Foundation. It first launched in 2015 and has been extended through 2020. The 500 Cities Project aims to provide census tract-level data on chronic disease measurements for the 500 largest cities in the United States. This information complements other data obtained by the County Health Rankings and Roadmaps, the Census Bureau, and the BRFSS. With this information it is possible to develop more targeted interventions for cities.

A total of 103,020,808 people were included, which represents $33.4 \%$ of the United States population. The city's population ranged from 42,417 to $8,175,133$. Waterloo, lowa was listed as one of the 500 cities evaluated in the project. The other cities in lowa included were Des Moines, Cedar Rapids, Davenport, Sioux City, and lowa City. There were 24 measures analyzed to understand behavioral risk factors and chronic disease.

This report used the most recent data published, which was from 2016 and 2017. Indicators were measured in crude rates and age-adjusted rates. A side by side comparison between 2016 and 2017 was created to identify and trends between the years. The second table compares the United States 500 City average, Cedar Rapids, lowa City, and Waterloo. This assessment will continue to add data as it is released in order to better identify and target public health threats in Waterloo, lowa.

Prevalencel of Self-Reported Obesity Among U.S. Adults by State and Territory, BRFSS, 2013

Prevalence『 of Self-Reported Obesity Among U.S. Adults by State and Territory, BRFSS, 2016

Prevalence ${ }^{\text {® }}$ of Self-Reported Obesity Among U.S. Adults by State and Territory, BRFSS, 2014

Prevalence ${ }^{\text {¹ }}$ of Self-Reported Obesity Among U.S. Adults by State and Territory, BRFSS, 2017

Prevalence ${ }^{\mathbb{1}}$ of Self-Reported Obesity Among U.S. Adults by State and Territory, BRFSS, 2015

Prevalence ${ }^{\mathbb{1}}$ of Self-Reported Obesity Among U.S. Adults by State and Territory, BRFSS, 2018

The figures above illustrate BRFSS data on adult obesity prevalence for each state. Each map displays data for a given year from 2013 to 2018. The prevalence of obesity has been increasing every year throughout the United States. In 2018, there were no states that had a prevalence of obesity less than 20\%. lowa was ranked alongside the highest states with an obesity prevalence greater than $35 \%$. In lowa, the average obesity prevalence for all racial ethnic groups for 20162018 was $34.6 \%$. The average obesity prevalence in lowa was broken down by race and ethnicity for 2016-2018 as well. Non-Hispanic White adults was $34.5 \%$, non-Hispanic Black/African American adults was 41.7\%, and Hispanic adults of all races was 34.4\%.

Data obtained from: http://www.cdc.gov/obesity/data/prevalence-maps.html.

## Leading causes of death by age group: 2016

In $2016,16.4 \%$ of the total population in lowa was 65 and older, and it is projected by the year 2050 this group will make up $19.7 \%$ of the population. As the population ages it is becoming increasingly important to understand health indicators and the barriers faced by this age group. The MHI for an individual in lowa 65 years and older was $\$ 39,433$ compared to all lowans averaging $\$ 56,247$. The poverty rate for people 65 and older in 2016 was $6.9 \%$ compared to $11.8 \%$ for all lowans. The percentage of lowans 65 years or older without health insurance coverage was $0.2 \%$ compared to all lowans at $4.3 \%$.

For lowans age 65 to 84 years of age the leading cause of death is malignant neoplasms, and the leading cause of death for lowans older than 85 years is diseases of the heart. Overall, the leading cause of death for lowans age 65 and older is diseases of the heart when combining both age categories.
