AJTC'S INCLUSIVE BUSINESS SECURITY SOLUTIONS

Email Security

AJTC's email security services go beyond simple filtering and protect your systems from new and emerging threats. Our email security allows for real-time protection to immediately block system threats including spam, virus, phishing, and other malware attacks.

Internet Security

Even the savviest users are not immune to online threats. Our services protect businesses from malware, ransomware and phishing attacks no matter where users go online. We safeguard your systems by identifying hazardous attack attempts before they reach you.

2-Factor Authentication

Weak or stolen passwords can allow hackers to easily access your system. Implementing two-factor authentication is an effective way to strengthen internal systems and add a layer of protection to your data. Users receive a push authentication or unique one-time code to verify their identity, making it much more difficult for cybercriminals to breach your system.

Endpoint System Encryption

Encryption of sensitive data protects it from getting into the hands of unauthorized users. Applying encryption to endpoints like laptops, tablets, and other sensitive systems is an effective way to safeguard proprietary, financial, health, or other private information.
