

The Trussed Rafter Association Voice of the Trussed Rafter Industry

Constructed of kiln dried stress graded timber and plated together with high strength steel webs, metalweb floor systems have a number of benefits compared with other floor and joist systems.

OPEN WEB DESIGN

The product delivers ease of access for services, allowing wiring, plumbing, and ducting to be accommodated under the floor without the need to be cut or drill holes in the joist.

LONG TERM STABILITY

The reduced section of timber used in the manufacture of the metalweb joists combined with the metalweb means less shrinkage is experienced leading to quieter and longer lasting floors.

SPEED OF ERECTION

Wide timber chords allow for easy fixings for both the floor decking and ceiling finish without the need for herringbone strutting throughout the floor.

REDUCED COSTS

Increased spans, simpler installation of utilities and services, flexibility of design and faster erection results in significantly reduced build costs.

SOUND AND FIRE PERFORMANCE

Metalweb floors meet all of the requirements for sound and fire performance as detailed in the Building Regulations. Please refer to technical data sheet for further information.

MADE TO MEASURE

Joints are designed and supplied to site for the specific scheme virtually eliminating site wastage.

LIGHTWEIGHT

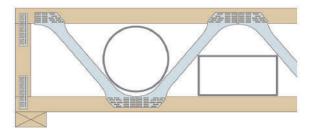

The open web structure means metalweb joists are lighter to handle than timber equivalents.
