

AP Statistics: Hypothesis Testing (Means & Proportions)

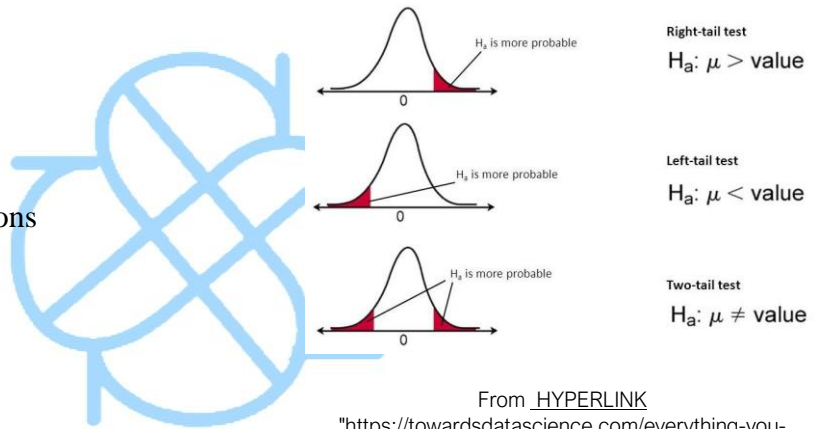

From Simple Studies, <https://simplestudies.edublogs.org> & @simplestudiesinc on Instagram

Hypothesis Testing

- A hypothesis test is used to see whether an assumption is statistically plausible by using sample data
- The basic formula for a hypothesis test is: $\frac{\text{Statistic} - \text{Parameter}}{\text{Standard Deviation of Statistic}}$
- The higher the Z or t score, the lower the p value, and the more evidence there is to reject the null hypothesis

Five Steps

1. Hypothesis
2. Conditions/Assumptions
3. Formula
4. P Value
5. Conclusion

["https://towardsdatascience.com/everything-you-need-to-know-about-hypothesis-testing-part-i-41c044b2c010"](https://towardsdatascience.com/everything-you-need-to-know-about-hypothesis-testing-part-i-41c044b2c010)

Step 1: Hypothesis

Hypothesis	One-Sample Mean	Two-Sample Mean	One-Sample Proportion	Two-Sample Proportion
H₀	$\mu = x$	$\mu_1 = \mu_2$	$p = x$	$p_1 = p_2$
H_a	$\mu < \text{or } > \text{ or } \neq x$	$\mu_1 < \text{or } > \text{ or } \neq \mu_2$	$p < \text{or } > \text{ or } \neq x$	$p_1 < \text{or } > \text{ or } \neq p_2$

- “Where $[\mu, p, \mu_1, \mu_2, p_1, p_2]$ is [context of problem]”
 - Define ALL parameters in the context of the problem
- Whether H_a is <, >, or ≠ depends on the problem

Step 2: Conditions/Assumptions

- Random Sample
 - “The stem of the problem states that [*sample*] was chosen at random”
 - “The stem of the problem states that [*participants*] were randomly assigned to the groups”
- Approximate Normal Distribution
 - “The stem of the problem states the distribution is approximately normal”
 - “Since $n = _ \geq 30$, by the Central Limit Theorem, we can assume the distribution is approximately normal”
 - For two samples, both n_1 and n_2 must be ≥ 30
 - “Since $np = _ \geq 10$ and $nq = _ \geq 10$, we can assume the distribution is approximately normal”
 - For two sample, $n_1\hat{p}_1$, $n_1\hat{q}_1$, $n_2\hat{p}_2$, and $n_2\hat{q}_2$ must all be ≥ 10
 - “Since the [*graphical display*] shows no outliers or strong skewness, we can assume the distribution is approximately normal”
 - You must provide a graphical display (preferably a box plot) if normality cannot be assumed by the other three ways

Step 3: Formula

- List the formula, your substitution, degrees of freedom (if using t) and your unrounded answer

- One-Sample Means
$$Z = \frac{\bar{x} - \mu}{\frac{\sigma}{\sqrt{n}}} \quad t = \frac{\bar{x} - \mu}{\frac{S}{\sqrt{n}}}$$

- Two-Sample Means

$$Z = \frac{(\bar{x}_1 - \bar{x}_2) - (\mu_1 - \mu_2)}{\sqrt{\frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2}}} \quad t = \frac{(\bar{x}_1 - \bar{x}_2) - (\mu_1 - \mu_2)}{\sqrt{\frac{S_1^2}{n_1} + \frac{S_2^2}{n_2}}}$$

- Proportions

Step 4: P

$$Z = \frac{\hat{p} - p}{\sqrt{\frac{pq}{n}}} \quad Z = \frac{(\hat{p}_1 - \hat{p}_2) - (p_1 - p_2)}{\sqrt{(\hat{p}_c)(\hat{q}_c)\left(\frac{1}{n_1} + \frac{1}{n_2}\right)}} \quad \hat{p}_c = \frac{X_1 + X_2}{n_1 + n_2}$$

Value

- The probability of obtaining a test statistic (Z or t) that is this much or more extreme
- If H_a is <
 - $P(Z < _)$
- If H_a is >
 - $P(Z > _)$
- If H_a is \neq
 - $2P(Z > _)$ if $Z > 0$
 - $2P(Z < _)$ if $Z < 0$

Step 5: Conclusion

- “Assuming H_0 is true, since the p value ([p value]) is [greater/less] than $\alpha = _$, we [fail to reject/reject] H_0 ”
 - A α will usually be given in the problem. If it is not, use $\alpha = .05$
- “We [do not/do] have sufficient evidence to suggest H_a , that [context of problem]”

Type I and II Errors

- **Type I Error:** You reject H_0 when you should not have
 - $P(\text{Type I Error}) = \alpha$
- **Type II Error:** You fail to reject H_0 when you should have
 - $P(\text{Type II Error}) = \beta$
 - Power of the test = $1 - \beta$
 - $P(\text{Rejecting } H_0 \text{ when you should have})$
 - Increases as α increases
- Which one is worse depends on the scenario

Match Paired t-Testing

- Most often used in a “before and after” scenario (e.g. dexterity before and after the subjects undergo a program) and comparing two things (e.g. amount of active ingredient in a name brand and generic brand drug).
- Hypothesis
 - $H_0: \mu_d = 0$
 - $H_a: \mu_d > \text{or } < \text{or } \neq 0$
 - *Where μ_d is the average difference (After - Before)
- Assuming Normality
 - Draw a box plot of A - B
- Compute the Match Paired t-test as if it were a normal hypothesis test (5 steps!)

Z vs t Distribution

- Means
 - Use a Z distribution when you have σ
 - Use a t distribution when you do not have σ (i.e. you have S)
- Proportions
 - ALWAYS use a Z distribution

Degrees of Freedom

- Only applies to t-distributions
 - The t-distribution varies with degrees of freedom
- $df = n - 1$
- For a Z-distribution, $df = \infty$

Calculator (TI-84 Plus)

- Stat → Test
 - Means
 - 1 = One-Sample Z-Test
 - 2 = One-Sample t-Test

- 3 = Two-Sample Z-Test
- 4 = Two-Sample t-Test
- Proportions
 - 5 = One-Sample
 - 6 = Two-Sample
