

MAX MIX HA

Humic Acid Blend

1-1-0

General Information

H2H Max Mix HA is a blend of H2H and humic acid (extracted from leonardite). Harvest-to-Harvest (H2H) is a protein hydrolysate liquid fertilizer made from recycled supermarket food. H2H contains nutrients that feed organisms that live in the soil, building soil fertility and improving the efficiency of your fertilization system. H2H also contains organic acids that can improve nutrient dispersion, availability, and mobilization in the soil. H2H Max Mix HA also contains humic acid derived from leonardite to further enhance nutrient dispersion and availability when co-applied with conventional fertilizers.

H2H Max Mix HA is meant to be used as part of your conventional liquid fertilization program.

Guaranteed Analysis

Total Nitrogen 1%
(1% Water Soluble Nitrogen)

Available Phosphate (P₂O₅)..... 1%

Derived from: Food protein hydrolysate and phosphoric acid.

ALSO CONTAINS NON-PLANT FOOD INGREDIENTS.

4% Humic Acids derived from leonardite and food protein hydrolysate.

Information regarding the contents and levels of metals in this product is available on the internet at:

Storage and Handling

Store in the original container, and do not mix with other fertilizer or pesticide products while storing the product as this could affect shelf stability. During winter months, be sure and store the container in an area protected from freezing conditions.

Application

H2H Max Mix HA is fine-filtered below 74 microns, and can be applied through any liquid application method including: banding equipment, water run through irrigation/fertigation systems, water run through drip lines, and/or sprayed directly on to soils in conjunction with other fertilizing materials upon application. H2H Max Mix HA is acid fertilizer compatible.

Always jar test before mixing with other fertilizers.

Drip Irrigation Injection Instructions

When injecting into solid set drip or drip tape irrigation systems, it is recommended to dilute the product 2:1 - 4:1 on pre-dilution with water, prior to injection to match water viscosity for better dispersion in the line. For injection rates, please consult the H2H Storage & Application Guidelines. Please consult your CSS sales representative if injecting material outside of label recommended rates.

Line flushing is recommended within 4 - 7 days of injection to properly maintain drip lines.
