COVID-19 Antigen Home Test Package Insert

A rapid test for the detection of SARS-CoV-2 antigens in anterior nasal specimens. For self-testing use. For use under an Emergency Use Authorization (EUA) only. Carefully read the instructions before performing the test. Failure to follow the instructions may result in inaccurate test results.

**PREPARATION**

1. Wash or sanitize your hands. Make sure they are dry before starting the test.
2. Read the instructions.
3. Check your kit contents and make sure you have everything. Check the expiration date printed on the pouch.
4. Open the pouch and lay the cassette on a clean, flat surface. Locate the Result Window and Sample Well on the cassette.

**SPECIMEN COLLECTION**

An anterior swab sample can be self-collected by an individual aged 14 years and older. Children aged 2 to 13 years should be tested by an adult.

**TEST PROCEDURE**

1. Remove the foil from the top of the extraction buffer tube.
2. Punch through the perforated circle on the kit box to form a tube holder. Place the tube in the tube holder.
3. Gently insert the entire absorbent tip of the swab head into ½ to ¾ of an inch. With children, the maximum depth of insertion into the nostril may be less than ¾ of an inch, and you may need to have a second person to hold the child’s head while swabbing.
4. Firmly rub the swab in a circular motion around the inside wall of the nostril 5 times. Note: A false negative result may occur if the swab is not swirled at least 30 seconds.
5. Place the tube in the tube holder. Note: A false negative result may occur if less than 4 drops of fluid are added to the Sample Well.
6. Gently squeeze the tube and dispense 4 drops of solution into the Sample Well. Dispose the tube in the trash.
7. Immediately place the swab into the tube and swirl for 30 seconds. Note: A false negative result may occur if the swab is not swirled at least 30 seconds.
8. Rotate the swab 5 times while squeezing the tube. Note: A false negative result may occur if the swab is not rotated five times.
9. Remove the swab while squeezing the tube. Dispose the swab in the trash.
10. Attach the dropper tip firmly onto the tube. Mix thoroughly by swirling or flicking the bottom of the tube.
11. Gently squeeze the tube and dispense 4 drops of solution into the Sample Well. Dispose the tube in the trash. Note: A false negative or invalid result may occur if less than 4 drops of fluid are added to the Sample Well.
12. Set the timer for 15 minutes. Result should be read at 15 minutes. Do not read after 30 minutes. Dispose the test cassette in the trash. Note: A false negative or false positive result may occur if the test result is read before 15 minutes or after 30 minutes.

**RESULT INTERPRETATION**

- **Negative**: If the Control (C) line is visible, but the Test (T) line is not visible, the test is negative. To increase the chance that the negative result for COVID-19 is accurate, you should:
  1. Test again in 48 hours if you have symptoms on the first day of testing.
  2. Test 2 more times at least 48 hours apart if you do not have symptoms on the first day of testing. A negative test result indicates that antigens from the virus that causes COVID-19 was not detected in your sample. A negative result is presumptive, meaning it is not certain that you do not have COVID-19. You may still have COVID-19 and you may still be contagious. There is a higher chance of false negative results with antigen tests compared to laboratory-based tests such as PCR. If you test negative and continue to experience COVID-19-like symptoms, (e.g., fever, cough, and/or shortness of breath) you should seek follow up care with your healthcare provider.
- **Positive**: If the Control (C) line and the Test (T) line are visible, the test is positive. Any faintly visible red or pink test (T) line with the control line (C) should be read as positive. You do not need to perform repeat testing if you have a positive result at any time.
  A positive test result means that the virus that causes COVID-19 was detected in your sample and it is very likely you have COVID-19 and are contagious. Please contact your doctor/primary care physician or your local health authority immediately and adhere to the local guidelines regarding self-isolation. There is a very small chance that this test can give a positive result that is incorrect (a false positive).
- **Invalid**: If a control (C) line is not visible, the test is invalid. If the problem persists, call (888) 965-0301 for assistance.
Q: WILL THIS TEST HURT?

A: No, the nasal swab is not sharp, and it should not hurt. Sometimes the swab can feel slightly uncomfortable.
