

The B3.5 seat weighs only 2.1kg and will fit into some of the narrowest vehicles in existence. It holds the driver in a comfortable reclined racing position. The belt holes have been optimised to enable the use of a Hans device and allow a full racing harness to be used (5 or 6 point harnesses are highly recommended on a reclined seat). The seat is supplied with a removable Dinamica® suede headrest pad as standard and can be supplied with matching back and cushion panels at extra cost. The B3.5 is a thin flexible single skin shell. Therefore, this seat must be supported by a suitable mounting frame, or attachment points on the existing bulkhead and roll bars. The recommended bolting points are shown below and we suggest using our special low profile fittings to attach to your fixing points. At least one fixing point must support at headrest level, bolted under the pad and two high up under the arms at chest level. Two further points should be at the front under each leg to support the weight of the driver.
