

Five axes of transformation for climate-scale nuclear deployment

The decarbonization challenge

The decarbonization challenge

To help with the decarbonization challenge

Nuclear energy needs to achieve

- Climate speed
- Climate scale

To help with the decarbonization challenge

Nuclear energy needs to be

- Fast to build
- An attractive investment
- Vanilla (like solar)
- Commercially financeable

Commercially financeable projects must be inside the commercial risk box

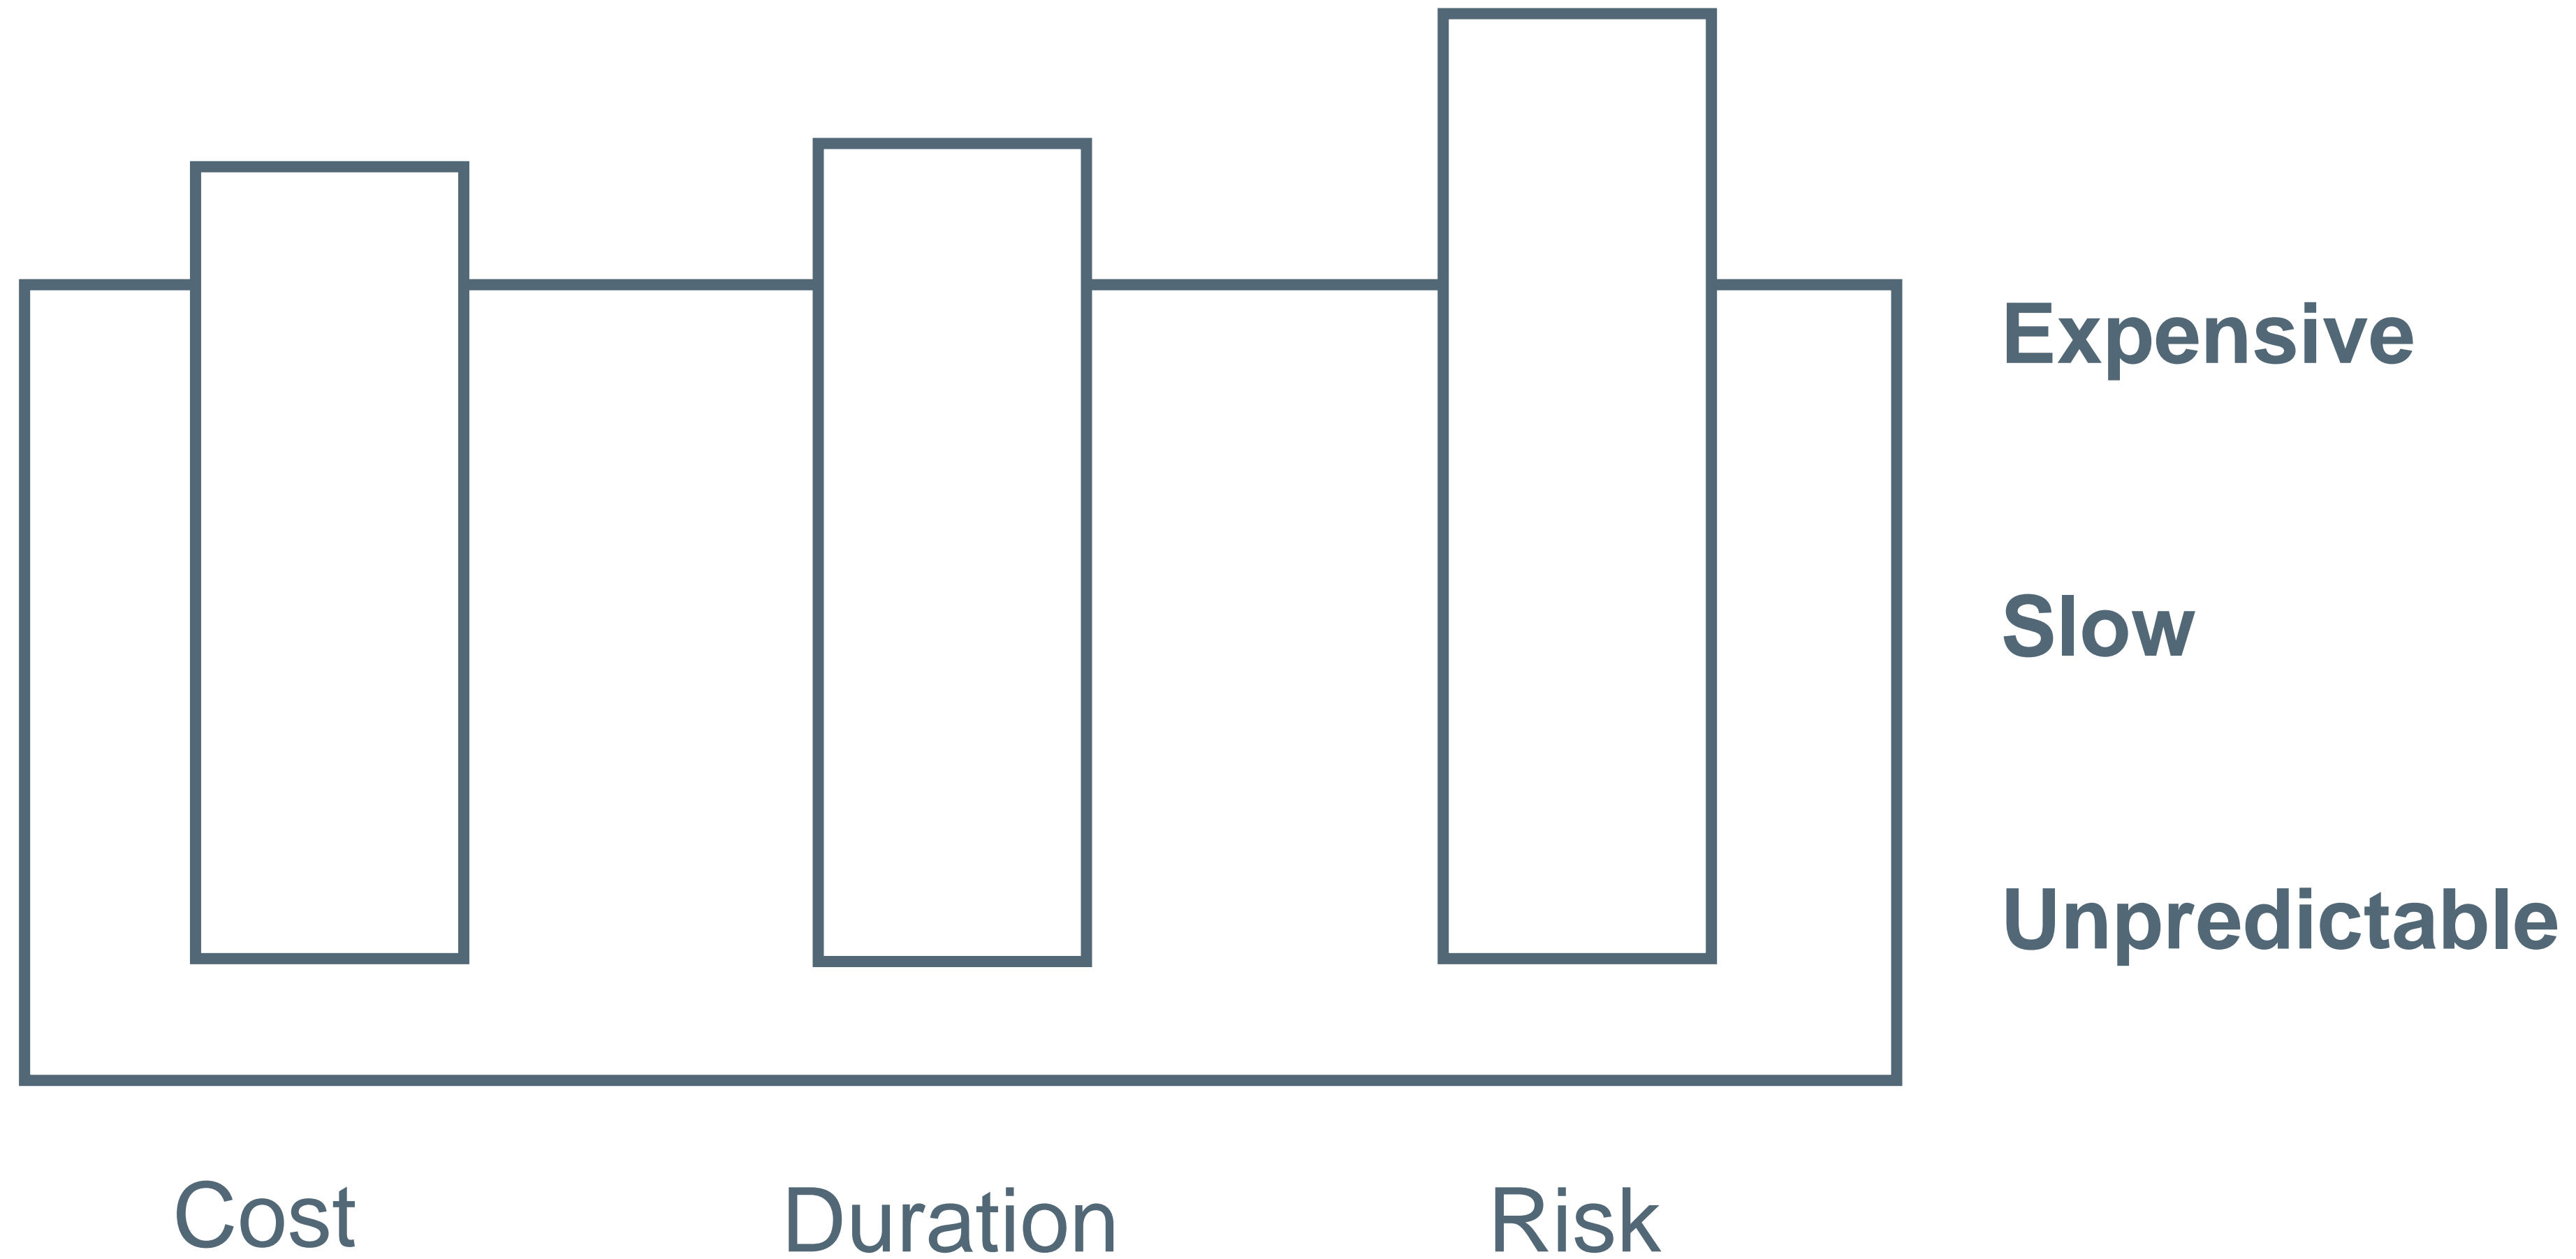

Cost

Duration

Risk

Nuclear is currently not commercially financeable

Nuclear is currently not commercially financeable

**Drivers of cost and risk
(Everything takes too long
and is too expensive)**

- Licensing
- Permitting
- Design
- Construction
- Operations-just expensive

Emerging solutions

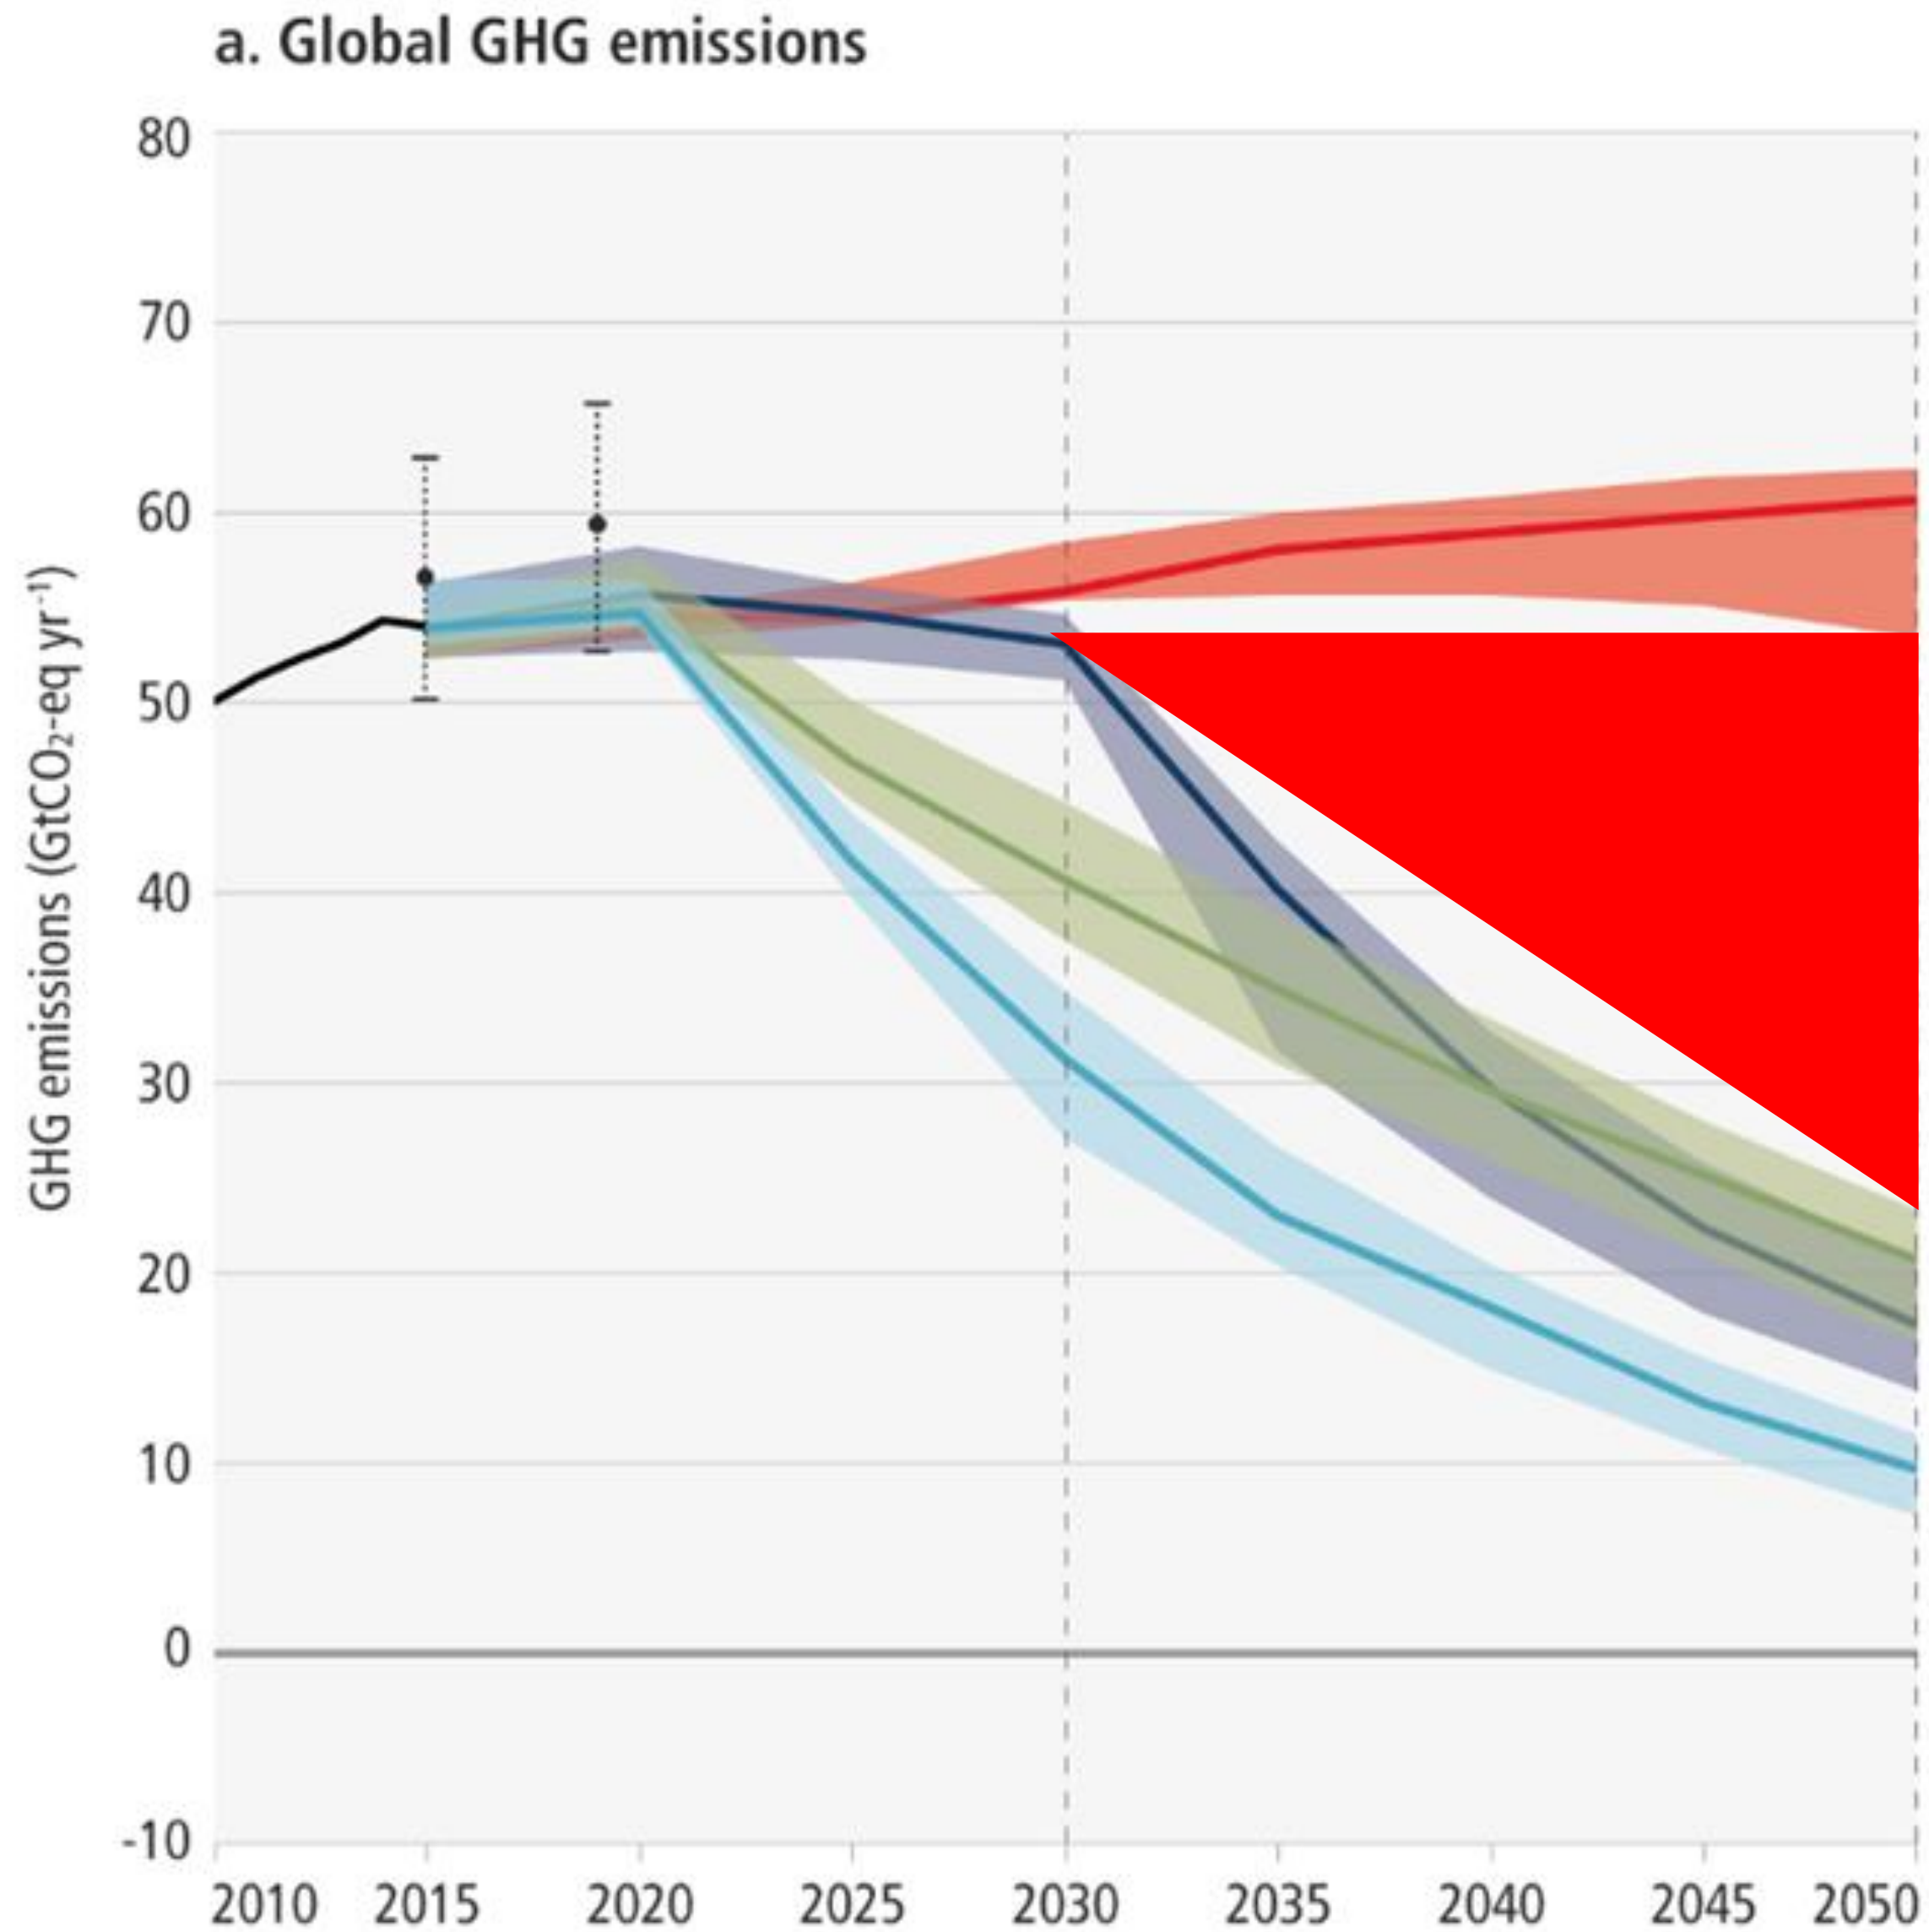

Project stage	Challenge	Emerging Solutions
Licensing	Long, Expensive	Product based licensing
Permitting	Permitting	Designs with no site impact
Design	Extensive bespoke design	Standardized product
Construction	Complicated, regulated construction	Mass-manufactured product
Operations	Complicated, staff-intensive operations	Automated/remote operations

These could transform nuclear energy

Emerging Solution	Effect
Product based licensing	Fast, low-cost licensing
Designs with no site impact	No EIS
Standardized product	No design costs
Mass-manufactured product	Low cost, high volume
Automated/remote operations	Low cost, scalable

The 10 Terawatt Gap

10 Factories, each making
1,000 50MWe
manufactured reactors =
500GWe/yr
For 20 years = 10TW

LucidCatalyst delivers strategic thought leadership to enable rapid decarbonization and prosperity for all.
