8.75 lbs./gal

WHAT IS TRI-HUMIC?

Tri-Humic is a highly oxidized form of liquid humic acids derived from high grade leonardite ore. Because of its organic nature, it has an extremely high cation exchange capacity. Tri-Humic also stimulates plant growth, promotes nutrient uptake, retains water-soluble inorganic fertilizers in the root zones and releases them to plants when needed, and increases the biological activity in the soil. It also promotes the conversion of a number of elements into forms available to plants, and increases the buffering properties of soil. This product is compatible with most solution grade fertilizers, except Calcium Nitrate. (A jar test should be performed when blending any new products.) Tri-Humic is also compatible with herbicides and pesticides. A high-quality 6% solution can be applied as a spray.

Guaranteed Analysis

Soluble Potash (K₂O).....1.00%

Derived from Potassium Hydroxide

Also contains non-plant food ingredient

6.00% Humic Acids derived from leonardite.

BENEFITS OF USING TRI-HUMIC

- Because of its extremely high ion-exchange capacities and its chelating properties, more nutrients end up in the plant instead of lost in the soil.
- Tri-Humic also increases seed germination, which increases crop production.
- Its catalyst qualities lead to a healthier, more vigorous plant.
- You can also save on nitrogen fertilizer costs because Tri-Humic increases the nitrogen uptake in the soil.
- By helping to buffer the plants against sodium and toxic levels of micro nutrients, the plants will also be healthier.

APPLICATION

Tri-Humic may be used on all grain crops, cotton, alfalfa, seed crops, beans, trees, vines, cole crops, tomatoes, sugar beets, peppers, rice and vegetables, and horticultural crops. Tri-Humic can also be applied before planting, during planting, as a side dress, as a foliar application, during irrigation, and during transplanting. It can also be applied to nursery and greenhouse plants. Contact your sales representative for application rates.
