Agility

Test-Driven Development

- White box, by the developers, concurrently
- Much more than finding bugs
 - JIT specification of a class/method
 - Useful documentation
 - Means towards improved design
 - Knowing when you're done
 - Improving morale, feeling confident

TDD Loop

1. Write a test, run it, watch it fail.
2. Write the simplest possible code to pass the test.
3. Run it, watch it pass, refactor as necessary.

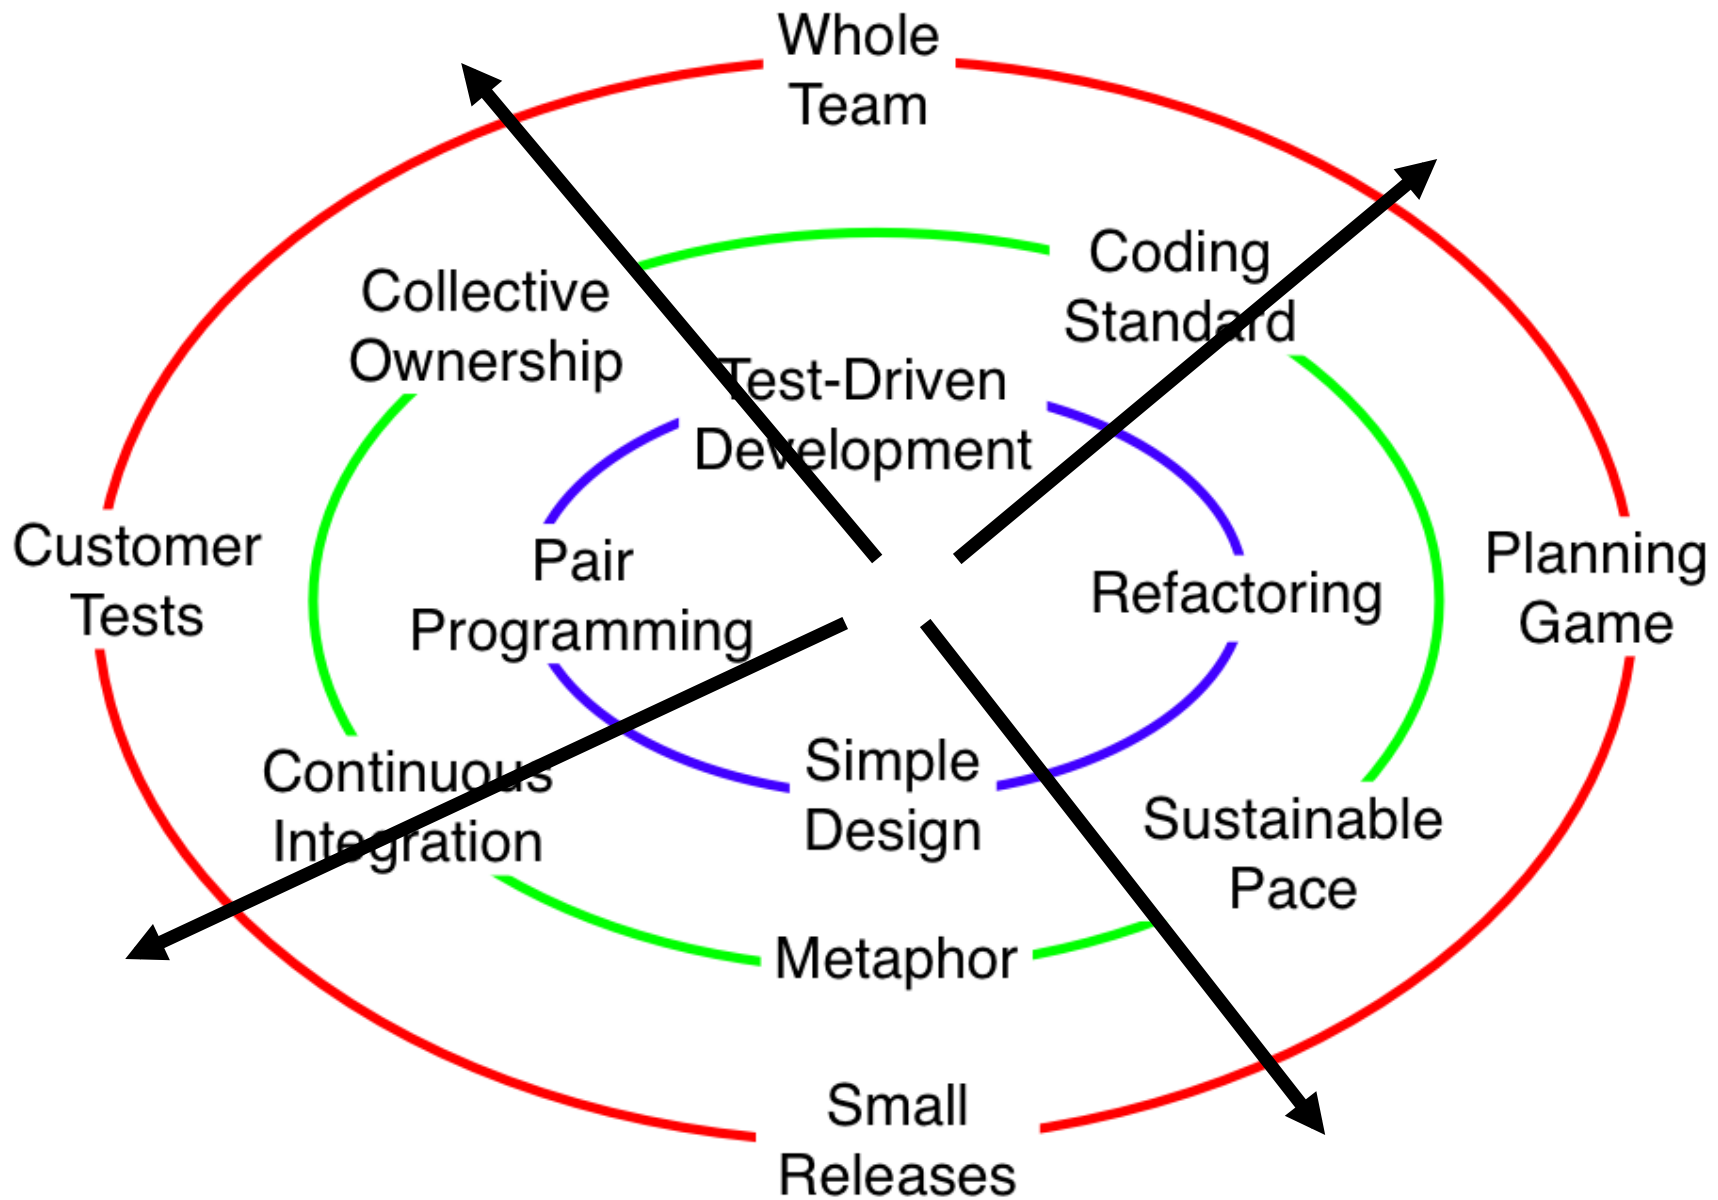

(Automation is necessary, not very difficult.)

TDD Impact

10x

Story-driven Development

Development tasks
Simple design
Unit tests

1. Customer dependency
2. Testing difficulty

Customer stories
Customer priorities
Customer tests

Major Benefit #1

Requirements

When you need them

In small chunks

Actionable, unambiguous, useful

With an opportunity to learn-as-you-go

Major Benefit #2

Data-driven project management

Iteration rituals and rhythm

Stories can be estimated (small chunks)

Measuring project velocity

Measuring team efficiency

Dynamometer Project

- 9 months
- 5 pairs of developers
- C#/.NET GUI client, C++ server

Not Done – Writing Drive Curve to Controller

When a sequence is executed, the Host will write all Drive Curves in the BEP standard format to the Controller in the /dyno3/ic/sequences/drivecurves directory.

Standard Format: Time (Seconds) TAB (0x09) Speed (MPH) Carriage Return (0x0D) Linefeed (0x0A).

Notes:

Acceptance Tests:

1. Run a sequence and validate that all of the drive curves from the solution appear in the /host/ic/sequences/drivecurves directory.
2. Open each of the drive curves and validate that they follow the BEP standard format.

Posted by Kevin Hykin | | [Post a comment](#)

Not Done – Sending Sequence to Controller

The Host will be responsible for using ftp to place the sequence file onto the Controller in the /dyno3/ic/sequences directory when the Run is selected by the user. The file format is dictated by the interpreter on the Controller.

Notes:

I am assuming that the ftp session is using the login of the root. If you would like to change the directory, just shoot me an E-mail with the logic and I will run it by the Controller group for approval.

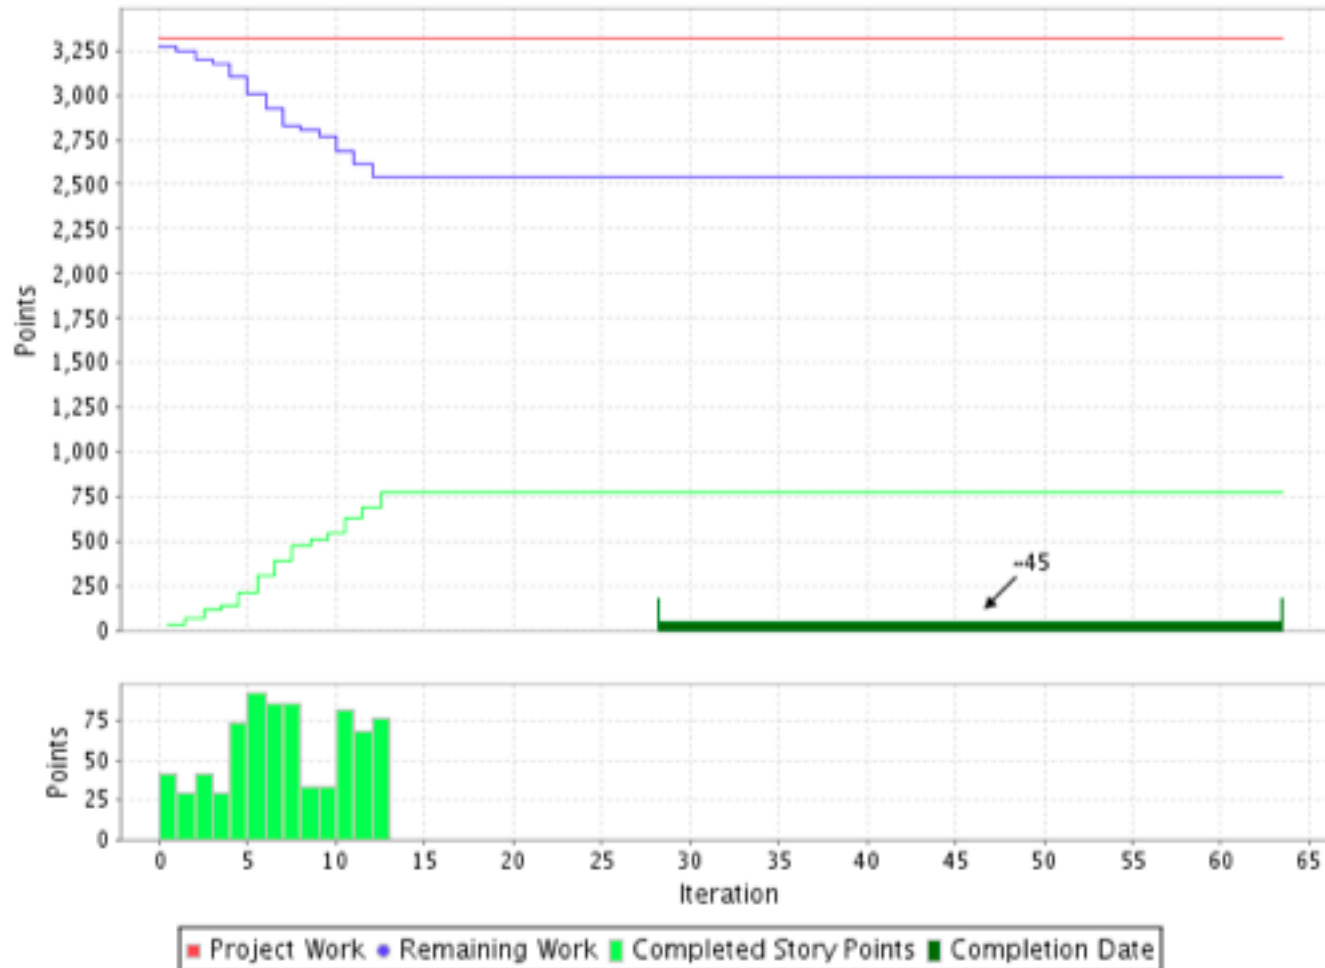

Acceptance Tests:

1. Open a sequence. Depress the Run button. Open a session to the controller and validate that the drive curve is under /root/host/ic/sequences directory.
2. Validate that the file is properly formatted.
3. Validate that the Controller could run the file and that it executed as expected.

Project Burndown

But wait, there's more!

Automating acceptance tests gets you...

- Executable requirements (even more unambiguous)

- Inexpensive for developers to run

- Regression testing ability

- Release process confidence

- A few more bugs

Ways to automate system tests

1. Commercial record/playback tools

- Tied to specific UI controls
- Tests are often brittle
- Code generation gone wrong
- Script language is more like GPL

2. Language-of-the-app tests

- Done by developers
- Expensive to develop

Domain Specific Languages

- a.k.a tiny, very high level, or application
- Do one thing, but do it well
 - More expressive, and efficient, but limited
- Historical goal: lay programmers
- Tim Menzies criteria
 - 1 day productivity
 - Elbow test

DSL for Acceptance Testing

- Describe tests in the language of the app
- Lots of recent interest
- Goals of DSL approach to acceptance tests
