Alurna
e-Learning Management Solution

Datasheet

URM

What is Alurna?

Alurna is an on-line learning management solution (LMS) which has been developed by URM to deliver cost effective awareness training courses direct to an organisation's end users. Alurna allows an organisation to deliver a varied, creative and interactive learning experience to users irrespective of device, time or location. The LMS provides extensive management functionality and reporting facilities and includes an optional and comprehensive testing mechanism which can be used to benchmark the progress and level of understanding of the registered users.

Alurna can be utilised to deliver any SCORM compliant content, enabling the LMS to provide on-line training on topics such as information security, business continuity, health & safety, anti-bribery etc.

5 Ways Alurna Can Benefit Your Organisation

1. Cost Effective Training

Ideal for both new starter and refresher training
Alurna is an excellent complement to face-to-face training. Alurna can be used to provide training to those individuals who are frequently off site, or those who are absent on days where training is initially provided on site. Alurna is also ideally suited to deliver both induction training for new starters, as well as annual staff refresher sessions or delivery of subject specific content in a short time frame.
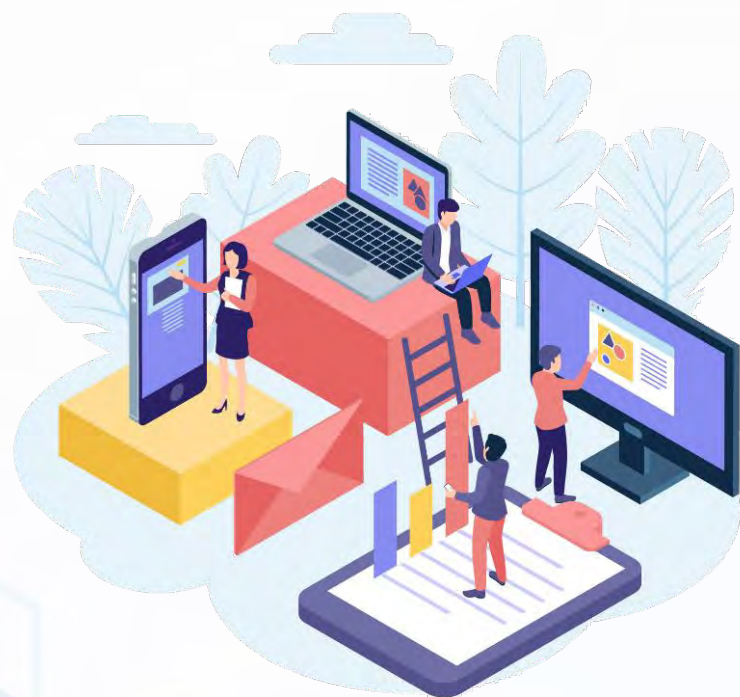

2. Flexible

Deliver anytime, anywhere and to any device

Hosted by URM, Alurna is accessed via a web browser ensuring it is available whenever required and accessible from any location.

Simple interface

Alurna's web-based interface has been designed to incorporate a simple workflow to guide the user.

Consistency of learning delivery

Alurna ensures consistency in awareness delivery and evaluation in that each user views exactly the same material in the same manner.

3. Tailored

Development of tailored material and updates

Alurna can be supplied with URM's pre-developed, best practice, core content as a 'plug and play' package, or with the option of establishing a branded interface and training content tailored to an organisation's specific requirements.

4. Management Control and Reporting

Tracking and reporting

Course reports for individuals and groups can be easily accessed at any point by management. Information, such as total course progress along with individual and departmental assessment results, can be viewed. This makes it easy to identify areas where users are consistently challenged, providing input into ongoing course content development or changes required to an organisation's operational policies or processes.

Individual user tracking

Each user can be individually tracked within the system to determine when they have started and whether they are part way through or have completed the course.

5. Compliant

Regulatory and legal compliance

Alurna's learning assessment tracking mechanism ensures that the results of those who have taken courses can be viewed in real time. As a result, an organisation can easily identify areas of non-conformance and take corrective actions to reduce the risk of non-compliance with legal or regulatory requirements.

URM's Approach to Developing Training Content

Drawing upon its unrivalled practical implementation of best practice in areas such as information security and business continuity, URM has developed a number of courses with pre-prepared 'best practice' base content. This base content can then be modified to reflect the specific requirements of the organisation e.g. culture, risk appetite, policies, plans and working practices. This approach enables the organisation to quickly implement high quality, bespoke and cost-effective awareness training.

It should be noted the courses detailed below reflect core content. This should be viewed as a guide; exact lengths and details of courses can be tailored to meet an organisation's specific requirements. Many other related courses are also available

Information Security Course (ISO 27001 Compliant)

The objectives of this course are typically to provide users with an understanding of:

- Key components and aspects of best practice information security (based on ISO 27001)
