

Accelerate Your SAP Transformation with Copado Robotic Testing for SAP

The global cloud transformation is in motion. With SAP planning to sunset on-premise support after 2027, customers must map out their multi-year migration to S/4HANA. This journey is full of risk and complexity – but Copado Robotic Testing keeps SAP teams on track. Find out how this cloud-based test automation platform helps users test, document and train with clicks – not code.

Challenges

- Manual processes that slow down cycles to production
- Business process documentation is often missing and outdated
- User adoption level is low due to the new system and UI
- Test scripts are unreliable because of different frameworks used in S/4HANA

Solution

Copado provides a revolutionary approach to delivering S/4HANA programs with better quality and reduced risk. With Copado, project teams can rely on one single source of truth.

The business process is recorded by business users and becomes the foundation for process documentation, automated end to end regression testing, accelerated manual testing, and end-user training material to maximize the adoption of the new system.

With a unified and consistent automation engine that supports all SAP UI frameworks, teams can create robust and easily maintainable end to end scenarios.

Features

Build E2E test scenarios with an easy-to-use interface

Manage defects directly in Copado

Customize reporting to see testing activities at a glance

Plan testing cycles, schedule test executions & test pipelines

Integrate with your tech stack: SAP Solution Manager, Jira, and more

Data-driven model to maintain your test data efficiently

Benefits of Embedding Copado in the Implementation Process

- Cloud-native, low-code, 3-in-1 synchronized solution to reinvent SAP teams document, test, and train end-users. Certified SAP-native integration
- Foster collaboration between IT & business with a simple UI and unique source of truth
- Improves efficiency, eliminating waste and duplicated work

"The low-code approach enables users to onboard quickly and then use it in their daily test creation. You have the ability to reduce all of the recorded transactions so that you can build your own consolidated end-to-end process. If something in the end-to-end process changes then it is very simple to insert a new part into it.

It brings a really big benefit in terms of keeping your system stabilized. In the end, you have fewer disruptions for the business."
