Codesign Product Research

Logic Model

Prepared for XtraMath
Dr. Lynne Harden
Overview
XtraMath worked with LeanLab Education to document the connections between using XtraMath and improving outcomes for students primarily in grades K–6.

XtraMath is an online math fact fluency program and supplemental curricular tool that helps students develop quick recall and automaticity of basic addition, subtraction, multiplication, and division facts through an individualized program tailored to each student’s pace of growth.

Students develop fluency in basic math operations through short daily XtraMath sessions that include practice activities, progress quizzes, and assessments. Students earn awards and certificates for completing various milestones, while teachers and family members receive regular student progress reports. School administrators also track school-wide usage of XtraMath activity through a weekly school usage report.

When used as intended, there is a strong argument that XtraMath helps students build a solid foundation for greater success in more advanced mathematics, and in turn become more confident when facing complex problems. This can lead to greater educational and professional opportunities throughout their life.

Problem Statement
Many K–6 students do not receive adequate practice to achieve fluency in basic arithmetic operations. Traditional classroom methods like ‘mad math minutes’ (i.e., worksheet-based math drills) are time-consuming to prepare, difficult to grade, and are not tailored to each student’s zone of proximal development. These methods can lead to or result in:

1. **Math Anxiety**: Inadequate and stressful practices contribute to math anxiety, affecting students’ confidence and willingness to engage in mathematical tasks.
2. **Poor Academic Performance**: Lack of fluency in basic math facts hinders progress in more advanced topics, creating a vicious cycle of poor performance and widening gaps in mathematical understanding.
3. **Inefficient Use of Educational Resources**: Teachers spend disproportionate time on preparation and grading, diverting resources from identifying and addressing gaps in conceptual understanding.

Requirements
- XtraMath users are based in the United States.
- XtraMath users either speak English or are Spanish-speaking English Language Learners.
- XtraMath is used in conjunction with a separate core math curriculum.
- XtraMath users have access to an internet connected device with an up-to-date browser and JavaScript enabled. Compatible devices include Apple devices with iOS 9 or later, Android 4.4 or later and Chromebooks that can run Android apps, and Fire devices running Fire OS 4 or later.

Outcomes Assumptions
- Seeing one’s own learning progression can help develop a growth mindset.
- A growth mindset that is developed in school or at a young age persists into adulthood.
- Motivation and a growth mindset gained in a school setting or in a particular subject can be transferred to a different context (i.e., life outside of the school or applied to a different subject).
 Specific descriptions of user interactions with the product

**Inputs**
- Assumptions about the product’s users and functionality

**Activities**
- Description of the immediately observable effects of using the product as intended

**Outputs**
- Students develop quick recall and automaticity of basic math facts (knowledge, skills, and confidence) for long-term storage in short-term memory. School administrators can identify areas of strength and weakness in math fact fluency progress (Kang, 2016; Jaekel et al., 2021).
- Students improve math teaching skills (confidence, engagement, instructional methods) and contribute to cutting-edge societal innovations (Aughinbaugh, 2012)

**Outputs (Cont.)**
- Students build a strong foundation upon which to learn more advanced math, such as algebra or fractions. Students have access to greater educational opportunities (Dweck et al., 2014) and career opportunities (Jansen et al., 2013).
- Students build a growth mindset in the classroom through increased confidence and reduced anxiety. Students are more capable of analyzing complex problems and thinking critically, and are more likely to pursue higher education and career opportunities (Boser, 2022).
- Students have increased confidence in their ability to find innovative solutions to problems in their personal and professional lives (Szabo et al., 2020). Students are more capable of analyzing complex problems and thinking critically, and are more likely to pursue higher education and career opportunities (Boser, 2022).
- Students develop personal and professional skills, such as time management, organization, and critical thinking.
- Students become lifelong learners who are prepared for future educational and career opportunities, and are better equipped to contribute to society.
XtraMath can be used by:
- Students in grades K-6 classrooms (primary users) and grades 7-12 classrooms (secondary users), homeschool environments, or homes with access to an internet-connected device
- Teachers and interventionists who teach math or support math learning
- School administrators
- Parents, guardians, and other supporting family members

XtraMath provides:
- Supplemental practice for helping students solidify their knowledge of math facts via spaced repetition (Kang, 2016) and adaptive learning
- Customized math content and individualized learning experiences for students based on where they are and what they are ready for
- Offline printables for reinforcement and application of math fact skills within real-world contexts
- A Spanish-language option to support English Language Learners

A student completes one XtraMath session (10-15 minutes) daily:
1. The student completes a 2-minute progress quiz to check what progress they’ve made.
2. The student uses the rest of the XtraMath session time to complete two practice activities to develop their fact fluency through spaced repetition.

The teacher or interventionist assigns a student an XtraMath program.

The student completes multiple placement quizzes to determine their level in the program, and a personalized learning plan is generated based on their individual math fact fluency needs.

When a student successfully completes an XtraMath program, their teacher assigns them a new program.

A detailed analysis of usage data at the school

Includes information about:
- What program a student is working on
- A student’s progress over time and fact fluency for math operations via a fluency matrix
- Awards and certificates the student has earned

Includes information about:
- Every question a student answers on any given day, how long they spent on it, whether they got it correct or incorrect, and if they answered it quickly, timed out, or idled

The teacher reviews the student’s progress each week.

The teacher or interventionist assigns a student an XtraMath program.

Teachers and licensed school administrators track usage and progress in their classroom and school throughout the year.

Students and teachers use XtraMath consistently each day over the course of weeks or months.

The teacher reviews the student's progress each week.

When a student successfully completes an XtraMath program, their teacher assigns them a new program.

The teacher or interventionist assigns a student an XtraMath program.

The teacher or interventionist assigns a student an XtraMath program.

Weekly School Usage Report

Class Report

Individual Student Progress Report/Dashboard

Individual Data Report

Immediate and Direct Feedback

- A detailed analysis of usage data at the school
- What each student in the class is working on
- Individual students’ progressions
- How correctly students are answering questions
- Whether or not a student has completed a program

- Every question a student answers on any given day, how long they spent on it, whether they got it correct or incorrect, and if they answered it quickly, timed out, or idled

- Each day students view their fluency matrix before each quiz to assess their own progress
- Students earn certificates when they have achieved fluency in all of the facts of a math operation
- Students earn trophies when they reach specific milestones

- Includes information about:
  - What program a student is working on
  - A student’s progress over time and fact fluency for math operations via a fluency matrix
  - Awards and certificates the student has earned

- Each day students view their fluency matrix before each quiz to assess their own progress
- Students earn certificates when they have achieved fluency in all of the facts of a math operation
- Students earn trophies when they reach specific milestones

- Each day students view their fluency matrix before each quiz to assess their own progress
- Students earn certificates when they have achieved fluency in all of the facts of a math operation
- Students earn trophies when they reach specific milestones

- Each day students view their fluency matrix before each quiz to assess their own progress
- Students earn certificates when they have achieved fluency in all of the facts of a math operation
- Students earn trophies when they reach specific milestones
**OUTCOMES**

**SHORT TERM**

- Students develop quick recall and automaticity of basic math facts (Knowles, 2010; Kang, 2016; Jaekel et al., 2021).
- School administrators can identify areas of improvement in math fact fluency or XtraMath usage for their school and implement solutions.
- Teachers, interventionists, and/or family members can intervene and provide extra support if an individual student’s math fact fluency progress is not where it should be.
- Family members increase awareness of their student’s education and become more involved in their progress.
- 47% of teachers reported in a 2023 internal survey using student progress reports in parent-teacher conferences.
- Teachers can understand why a student is struggling and fine-tune their XtraMath program.
- Students see themselves making progress and learning math, and are motivated to continue learning (Jansen et al., 2013).

**MEDIUM TERM**

- Students build a strong foundation upon which to learn more advanced math, such as algebra or fractions.
- Students perform better on national math assessments, such as the NAEP mathematics assessment.
- 90% of teachers agreed in a 2023 internal survey that using XtraMath helped their students meet math grade standards.
- Teachers improve their math teaching skills and develop better math teaching strategies.
- Students build a growth mindset in the classroom through increased confidence and reduced anxiety.
- 78% of teachers agreed in a 2023 internal survey that students have more confidence and less math anxiety after using XtraMath.

**LONG TERM**

- Students with better math skills earn higher financial income (Hanushek et al., 2013; Boser, 2021) and contribute to cutting-edge societal innovations (Abd Algani, 2022).
- Students are more capable of analyzing complex problems, thinking critically, and finding innovative solutions to problems in their personal and professional lives (Szabo et al., 2020).
- Students have access to greater higher educational (Aughinbaugh, 2012) and career opportunities (Koedel & Tyhurst, 2012).
- Students become lifelong learners (Dweck et al., 2014).
- Students improve their math teaching skills and develop better math teaching strategies.
- Teachers can understand why a student is struggling and fine-tune their XtraMath program.
- 78% of teachers agreed in a 2023 internal survey that students have more confidence and less math anxiety after using XtraMath.
“The history of mathematics indicates that whenever a civilization placed a high value on mathematical knowl-
edge, it made remarkable progress. Mathematics offers a commitment to technology and science development. 
Mathematics has an essential and distinctive effect on human communities and a strategic part in the growth of
humanity as a whole.”

“The higher the success rate, the more children played in Math Garden (computer–adaptive math program),
and the larger the improvement in math performance. This result suggests that practicing math frequently at one’s
own ability level improves math performance, and that the experience of success stimulates this practice.”

cy Insights from the Behavioral and Brain Sciences 3(1), 12-19.

“Having the initial study and subsequent review or practice be spaced out over time generally leads to superior
learning than having the repetition(s) occur in close temporal succession (with total study time kept equal in both
cases).” Across 254 studies comparing massed versus spaced practice on later memory for verbal information
(e.g., words, sentences, facts, passages), overall, spaced practice dominated massed practice in recall perfor-
mance.”

cation facts for regular education sixth graders. [Doctoral dissertation, Walden University]. Walden Dissertations and
Doctoral Studies Collections at ScholarWorks.

“...students who were administered daily timed practice drills performed statistically higher on the posttest than
did the control group [no timed practice drills] and first treatment group [weekly timed practice drills].” “...after 8
weeks, students who received written, timed practice drills, either daily or weekly, outperformed students who re-
ceived no treatment.” These results confirm...that written, timed practice drills did significantly change the auto-
maticity rate in basic multiplication facts for sixth-grade math students, and the change is a positive one. With re-
gards to the frequency of written, timed practice drills, an ANOVA showed a significant difference in the gain scores
of students who received daily written, timed practice drills compared to the groups who received weekly drills or
no treatment of drills.”

“...students who take an advanced academic math curriculum in high school (algebra II or precalculus, trigonom-
etry, or calculus) are about 17 percentage points more likely to start college at a 4-year school by age 21 compared to
those students whose highest math class was algebra I or geometry.”

“If a student had improved reasoning ability with data, statistics, graphs, and spatial relationships — as measured
by a standardized exam — the total expected increase in earnings would be an additional $32,000 per year for an
35–54 year old, full-time U.S. worker. The total accrued amount in earnings for an individual for better math skills
over two decades would be $400,000.”

“Longitudinal research shows that students’ mindsets about intelligence predict their academic performance in
real-world settings...Analyses showed that the students with a growth mindset earned higher grades because they
valued learning over looking smart. They saw effort as a virtue, because effort helps to develop ability. And they
tended to perceive academic setbacks as a call to increase their effort or to try new strategies.”

“On average, a one standard deviation increase in numeracy skills is associated with...a 28 percent [wage increase
among prime–age workers] in the United States.”
