Adhesion and Cementation Choosing between “Simple” and “Complex” techniques

It is true that dentine bonding and cement technologies have advanced so far, that we can bond just about anything onto a tooth. Some materials are quite complex and technique sensitive, whilst others are now almost embarrassingly easy yet very effective.

This 90 minute lecture will help to explain which bond/cement is the right one for each clinical indication. Do you need to go through multiple steps to bond your composite or your crown, or will the newer, single-step cements and bonding agents work just as well?

In this short presentation, Michael will provide an overview of the products available, how they work and provide tips on which systems may be best for each clinical situation.
