Pulse: Your blockchain investigator

Insulating your organization from illicit activity on the blockchain is critical — especially from a compliance and risks perspective. Pulse maps the entire blockchain, providing a complete view into on-chain activities, enabling AML operations, ransomware payment tracking, crypto asset recovery, and more. The accompanying dashboard makes it easy to understand where any and all funds originate, where they go, and who they are attributed to. This ensures the identification of any illicit transactions — should they occur — in real time.

Powered by SourceFlow™, an intelligent network expansion technology, crypto teams can gain visibility into entire transaction histories and automate resource-intensive processes, streamlining investigation workflows.

Trace funds with confidence

View and track funds, their source or ultimate destination, and the exact points where they have entered or exited the ledger.

Data-first approach to investigations

Harness the power of the largest database of known bad actors and proprietary clustering algorithms to unlock intelligent analytics which are unmatched in the market.

Proactively identify & manage risks

Deep levels of attribution enable the detection of nested addresses as well as beneficial owner and secondary address data to identify hidden risks.

elementus

Blockchain problems are data problems

Without a single source of truth across the blockchain, it's impossible to know who you can trust to do business with. Insufficient tooling exacerbates the problem as crypto teams often waste precious time and resources integrating multiple point solutions, or freemium offerings, that offer an incomplete picture of risk.

Limited Visibility

Incomplete and siloed blockchain data results in the lack of visibilit into activity, making it impossible to map data attributions

Bad Intelligence

Without comprehensive and unified data, crypto teams can't accurately scope out the entirety of their risks to make smart decisions
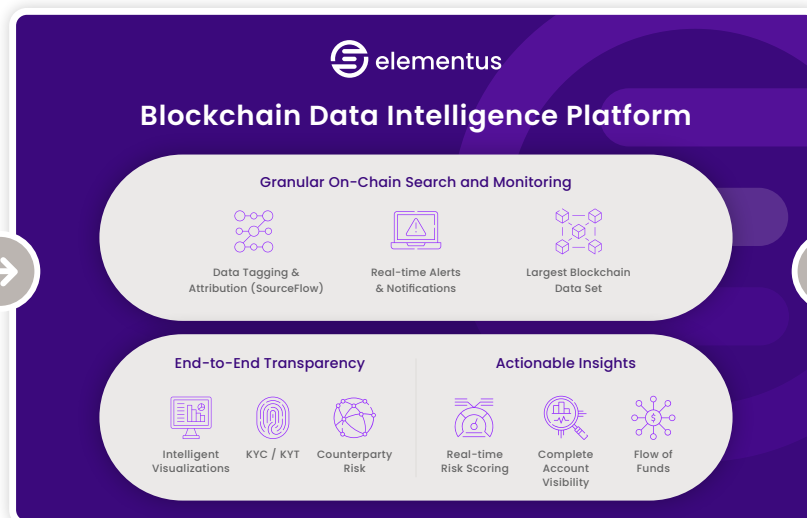

Risk Vulnerability

Incomplete data equals an inability to see the full picture, making it easier for bad actors to evade detection from security defenses

Partner with Elementus for all your blockchain needs

Elementus is a data-first web3 company on a mission to help forward thinking, data-driven organizations of all sizes to leverage the power of blockchain. Whether you're investigating on-chain activities, identifying risk, discovering valuable market intelligence, or a combination of all three, our platform provides the most complete data set and sophisticated attribution capabilities on the market, resulting in the actionable insights you need to grow and prosper safely in web3.
