The traditional perimeter of cybersecurity is dead, and Zero Trust is the way to keep your business safe. Now, no user, device, or service is assumed to be inherently safe, irrespective of where it's located. They must all be authenticated, authorized, and monitored regardless of location or context. Instead of hoping defenses like firewalls will keep your assets and intellectual property safe, Zero Trust relies on smart system of controls at every point of access to allow only those with the proper credentials the permissions they need.
