

Position Statement

Responsible Use of Natural Resources

October 2021

29Metals is committed to managing its impact on finite natural resources and protecting the environment through all stages of our business, from exploration through to development, operations, rehabilitation and closure. We integrate mine closure and progressive rehabilitation into the life-cycle of our operations to minimise our environmental legacies.

Water use

29Metals is committed to taking meaningful steps to reduce the amount of fresh water and groundwater used in mining and ore processing operations. 29Metals has programs in place at each of its operating sites to identify and implement strategies designed to reduce the volume of fresh water and groundwater drawn from surface and groundwater sources for use at its mines, including strategies for the treatment and re-use of process wastewater.

Biodiversity

29Metals will implement integrated approaches to resource development and environmental management in areas where we operate to contribute to the conservation of biodiversity.

Energy use and emissions

We are establishing documented processes to identify and manage risks and opportunities for the efficient use of energy, reduce carbon intensity at our operations, minimise air pollution and reduce waste generation.
