Laser & Cataract

A cataract is the inevitable clouding of the eye's natural lens, resulting in blurred vision.

Cataracts affect millions of people world-wide annually and cataract surgery is the single most commonly performed surgical eye procedure in the world. Treatment involves removal of the cloudy lens using ultrasound energy and insertion of a clear lens in the eye (intraocular lens or IOL). Both eyes can be treated on the same day, and life returns to normal in 24 hours!

How do cataracts affect you?

In the early stages you may not be aware that you have a cataract developing, but as it progresses you may lose your driver's licence as it will affect your distance vision. There are other symptoms like blurred or fuzzy vision that affect reading. The way the cataract affects your vision depends on the size and location of the cloudy areas in the lens of your eye. Some people experience double vision or difficulty driving at night, and some become more sensitive to light and experience glare.

Advanced Cataract Technology

The cataract procedure is a painless, quick, proven method of restoring vision and can be carried out by one of our experienced eye surgeons at our Re:Vision Sight Correction Centre in Auckland.

The cataract procedure is typically done with numbing gel (no injection), performed in a stitch-less manner and does not require you to wear an eyepad, allowing most patients to **return to their normal activities within a day** or so. Your surgeon will **painlessly** remove the clouded lens and replace it with a clear, ultra high-definition IOL,

which is customised to match your eye's prescription, successfully restoring your vision.

More advanced IOL's are being developed each year to improve the procedure's safety and offer even better vision outcomes.

The Cataract Surgery Specialists

As Auckland's Cataract Surgery Specialists, our surgeons have performed over 30,000 cataract procedures, and at Re:Vision we use the latest high-definition vision intra-ocular lens (IOL) technologies. This includes Premium IOLs that help to reduce post-operative spectacle use: 1. Toric astigmatism reducing IOLs, 2. Trifocal & Multifocal IOLs, 3. Extended depth of focus (EDoF) IOLs, for those who would love a life with a whole new level of freedom from wearing glasses.

Insurance companies all cover

Re:Vision is an Affiliated Provider with Southern Cross Healthcare with a simple automatic approval process, and we are accredited with

all other insurance providers. Our friendly staff will help to make the whole process stress-free, including helping our self-funding patients with easy-payment plans if desired.
