DiGi

Leverage RapDev's DiGi:

An open-source, GenAI developer co-pilot, custom-built to meet the needs of your organization on the ServiceNow Platform

Say hello to DiGi

DiGi provides extensibility and customization to meet your desired GenAI goals by **leveraging any LLM you have access to**, as well as your own private and custom-trained LLMs to **rapidly accelerate your ServiceNow application development.**

More than a code generator, DiGi has a framework which provides a flexible and configurable AI future on ServiceNow.

Configure parameters for your chosen model	Integrate with popular models or AI engines	Configure prompts, prefixes, & postfixes for messages sent to the AI engine	Validate changes prior to DiGi modifying your environment	Have a full trace log of everything that AI does on your platform

Cut code writing time by 50% using DiGi

For example, a user types '@digi' in a ServiceNow script field, followed by a written statement	DiGi sends that statement to the configured AI engine and provides the generated script for the developer	The developer accepts the changes and DiGi adds the new code to the script field

Get Started with DiGi on GitHub
