# Value Proposition

## About:

Our platform is a **community-focused** platform designed for individuals undergoing **lifestyle transitions**. We prioritize **physical and mental** wellness by encouraging **group-goal** accomplishments, uniting people in their shared journey towards better **well-being**.

*Our Mission Statement: A collective pursuit of well-being.*

*Name Origin: Derived from the Greek word, Enosis, which refers to the movement of communities that formed the modern political and social union of Greece*

# Key User Benefit:

Leverage the power of **community** to motivate, inspire, and drive progress.

**No one goes** through a lifestyle or wellbeing change **alone.**

02

# Problem and Solution Space Overview

# **Problem Space:**

Lifestyle transitions can often be lonely, causing feelings of isolation, discouragement, and a sense of being overwhelmed

# **Solution Space:**

By setting shared goals, members can motivate and push each other forward, creating a snowball effect of positivity and progress

03

## High-Severity Heuristics

04

# Key UI and Product Revisions

# Triaging HE Violations

## **Pain.**

Issues that cause intense frustration for the user, affect usability across user flows, or cause an immediate abandonment from the user experience.

## **Density.**

Issues that appear in critical, highly trafficked areas on the application that affect a high frequency of users.

## **Impact.**

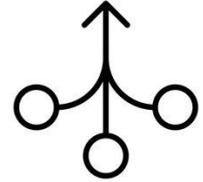

Issues that actively block the user from completing key tasks or activities in the application.

# Sorting Violations

Clarify

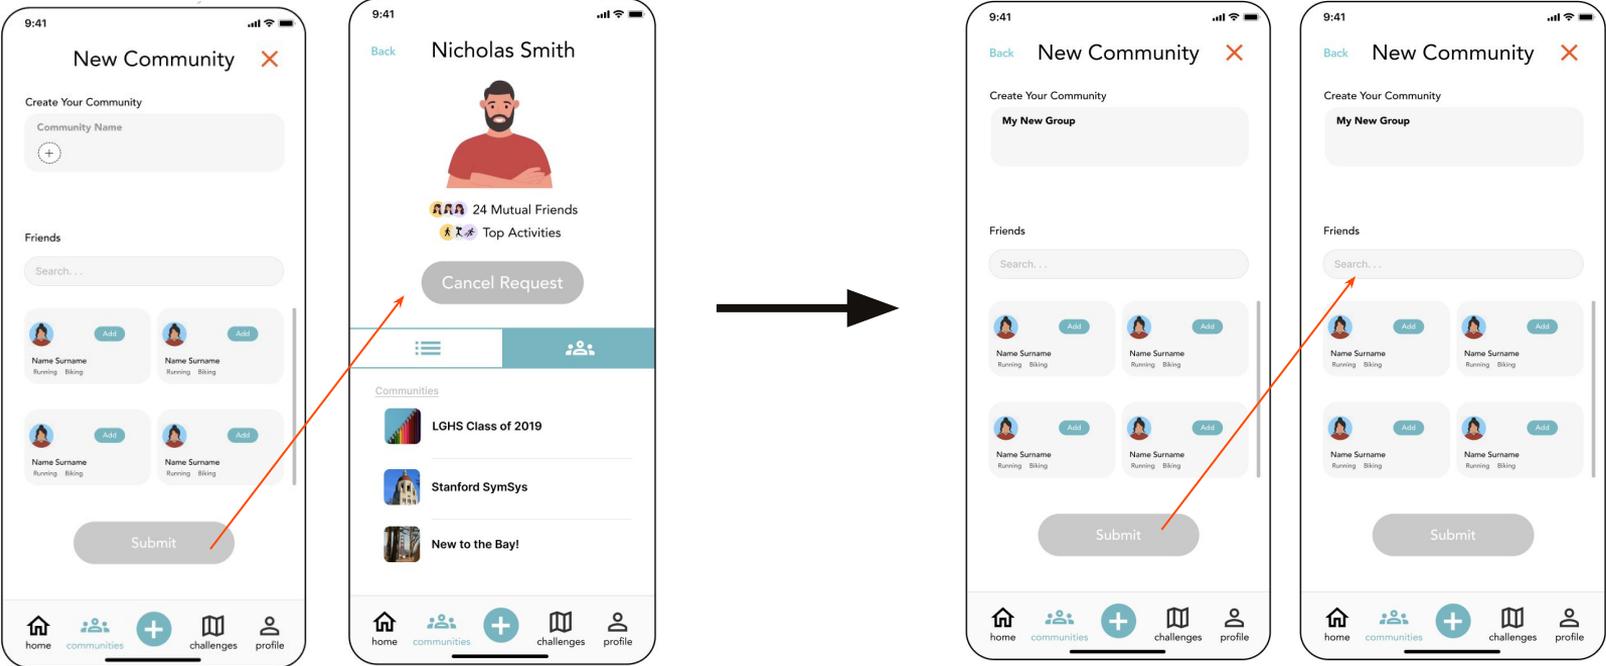

Simplify and  
Reduce

Robust Search and  
Navigation

# Revision #1 (Robust Search and Navigation)

Before

After

# Revision #1 (Robust Search and Navigation)

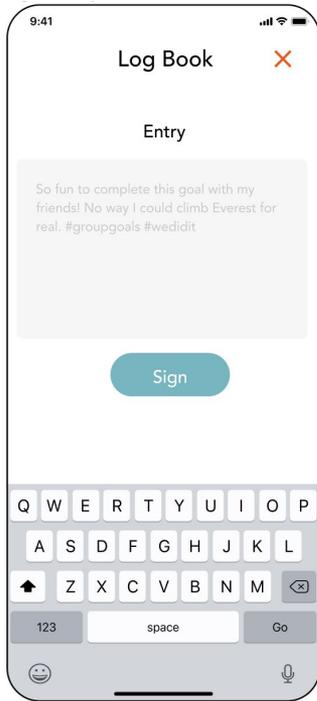

## Rationale

- Unexpected redirections can **confuse** and **panic** users, as it interrupts their user flow

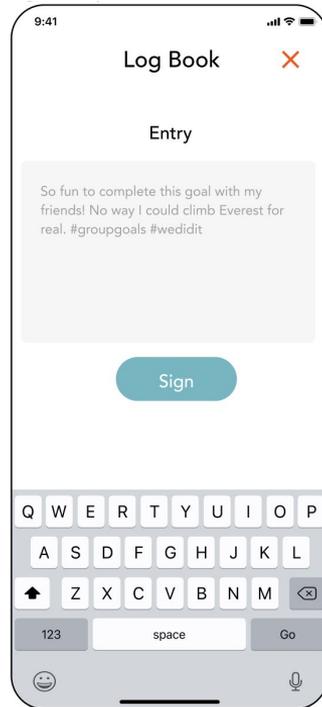

## How The UI Change Drives Usability Goals

- Accounts for the possibility of user errors such as misclicks
- Ensures such misclicks do not accidentally redirect to other parts of the application, improving the **efficiency** in which a user is able to complete their task.

# Revision #2 (Clarify)

Before

After

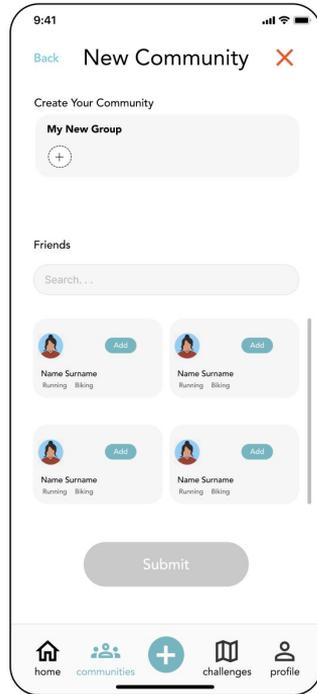

## Rationale

- Due to a **lack of contrast**, users (especially, visually impaired ones) may have trouble reading the existing placeholder text and gathering comment ideas.

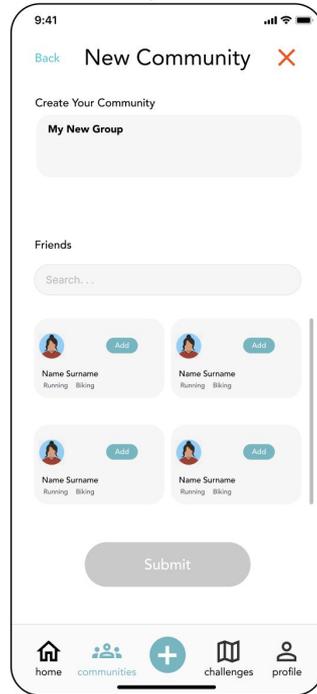

## How The UI Change Drives Usability Goals

- Improving contrast will allow for ease and speed of reading, improving the **efficiency** of the task completion

# Revision #3 (Simplify and Reduce)

Before

After

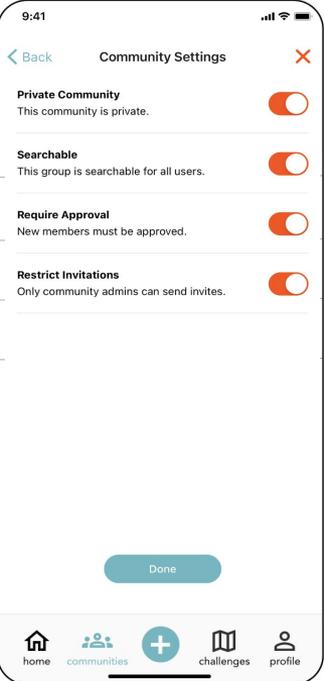

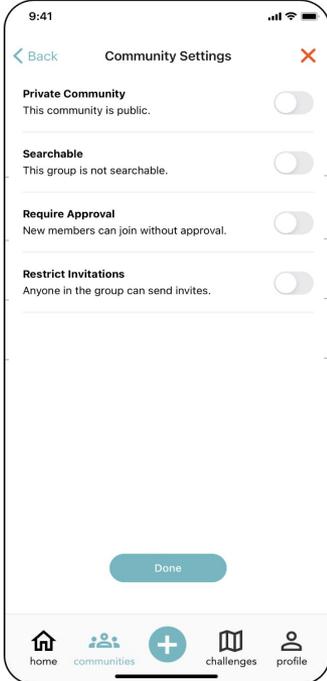

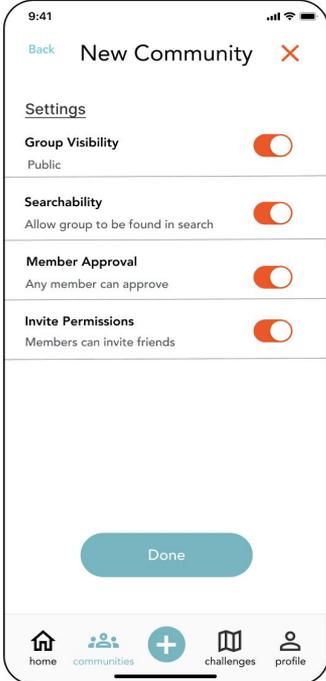

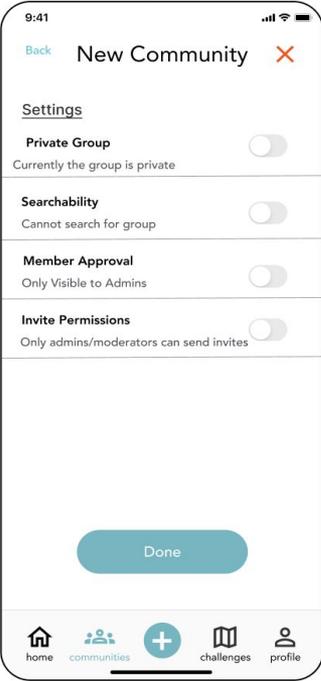

## Rationale

- An unnecessary, **repetitive** step is present, as the “Add” button should provide a direct way to add friend

## How The UI Change Drives Usability Goals

- Taking a “Less is More” minimalist approach, we encourage interactive search and visually additions of users, which is more **fun** for the user

# Revision #4 (Clarify)

Before

After

# Revision #4 (Clarify)

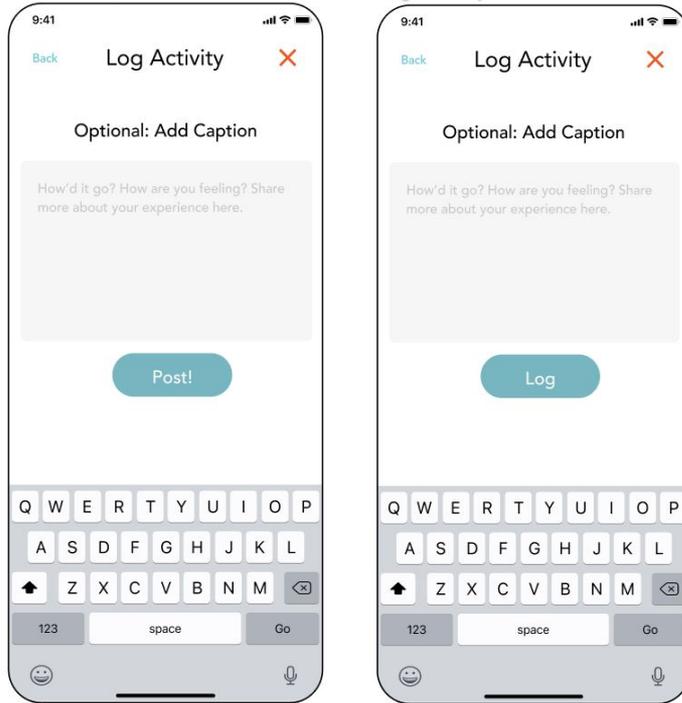

## Rationale

- Toggling in between settings changes the descriptions, **confusing** users on the current state the system is in

## How The UI Change Drives Usability Goals

- By using consistent descriptions and language to describe the state of the system, we can simplify to just the “yes” and “no” binary for user choice and improve **learnability** of how the system settings work

# Revision #5 (Clarify)

Before

After

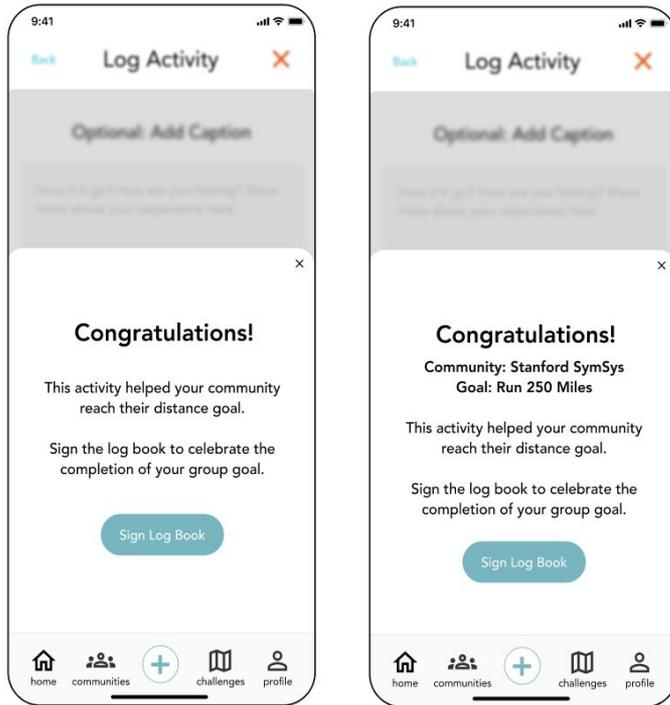

## Rationale

- Users **lack understanding** of when exactly their activity is successfully logged

## How The UI Change Drives Usability Goals

- We standardize the button language to “Log”, so that users can **intuitively** understand that they are in the process of logging the activity and do so successfully when they click “Log”, driving forward **learnability**

# Revision #6 (Clarify)

Before

After

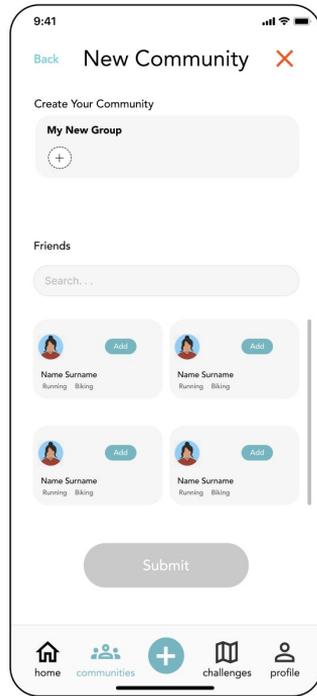

## Rationale

- **Lack of clarity** around which community a user contributes to and what the group goal is

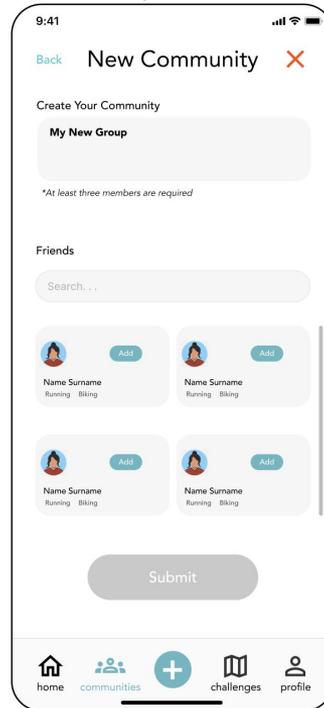

## How The UI Change Drives Usability Goals

- By providing such information on the UI (higher on the visual hierarchy, too), users quickly understand their contributions, improving **learnability** of use

# Revision #7 (Clarify)

Before

After

## Rationale

- **Lack of clarity** around minimum requirements for group creation

## How The UI Change Drives Usability Goals

- By providing such information up front to the user (\*), users are less likely to run into this error when submitting, improving **efficiency** of use

# Unaddressed Violations

## Violations

### H2: Match Between System and the Real World

The function of the “+” button at the page's bottom is not immediately clear. Severity: 3

## Rationale

User-testing and feedback from latest versions proves it is intuitive.

### H6: Recognition Rather Than Recall

Logbook and Captions have very similar UI, but the pages serve different purposes. Severity: 3.

We want to prioritize standards and consistency in UI cross-pages.

**H6: Recognition Rather Than Recall** After exiting from the logbook, it's very unclear where one can access it again. Severity: 3.

Log book would only be accessible to users earned the option to (i.e, as a reward/incentive).

### H6: Accessible Design

The “x” button on the logbook pop-up is too small. Severity: 3.

User-testing does not reveal this as a pain point.

### H6: Accessible Design

After issuing a friend request, I can't go see what the status of that request is. Severity: 3.

Friend request status is indicated by status of the button on profile of said person.

05

# Prototype Implementation

We implemented our high-fidelity prototype on

# React Native, Github, Expo, and VS Code

## Pros

- Easy simulation of various device screens via Expo
- VSCode makes it easy for file organization and synchronization
- Github allows for version control and cross-team collaboration
- React Native allows for simple development for cross-platform apps

## Cons

- React Native has a steep learning curve, for beginner users
- Frequent merge conflicts or issues on Github with team members
- Compatibility of distinct versions of React Native and dependency issues, led to interruptions in workflow between team members

# Implemented Features

- Supabase-backend database for the information captured during the user profile registration and sign-in process; users can successfully create their own profiles and we would capture the appropriate data
- Ability for a user to log their activity, specifying which activity (including custom activities), metric, and performance
- Users can specify user profiles, add them, and create new communities on the platform

# To-Dos and Plans to Finish

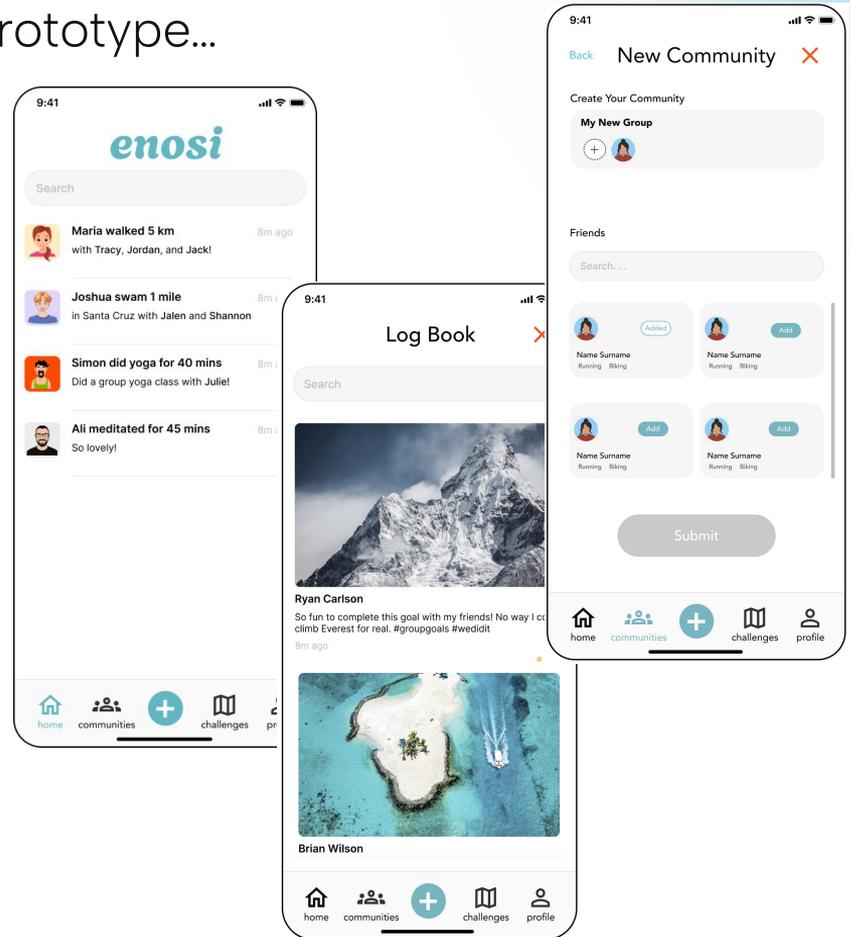

- Creation of the Log Book, and keeping track of shared performance in backend
- Creation of the Profiles page, and being able to add/cancel friend requests
- Creation of the Challenges page, and populating key activities based on user interests and activity

Taking a closer look at our high-fi prototype...

# Enosi

## Hard Coded and/or Wizard of Oz Features

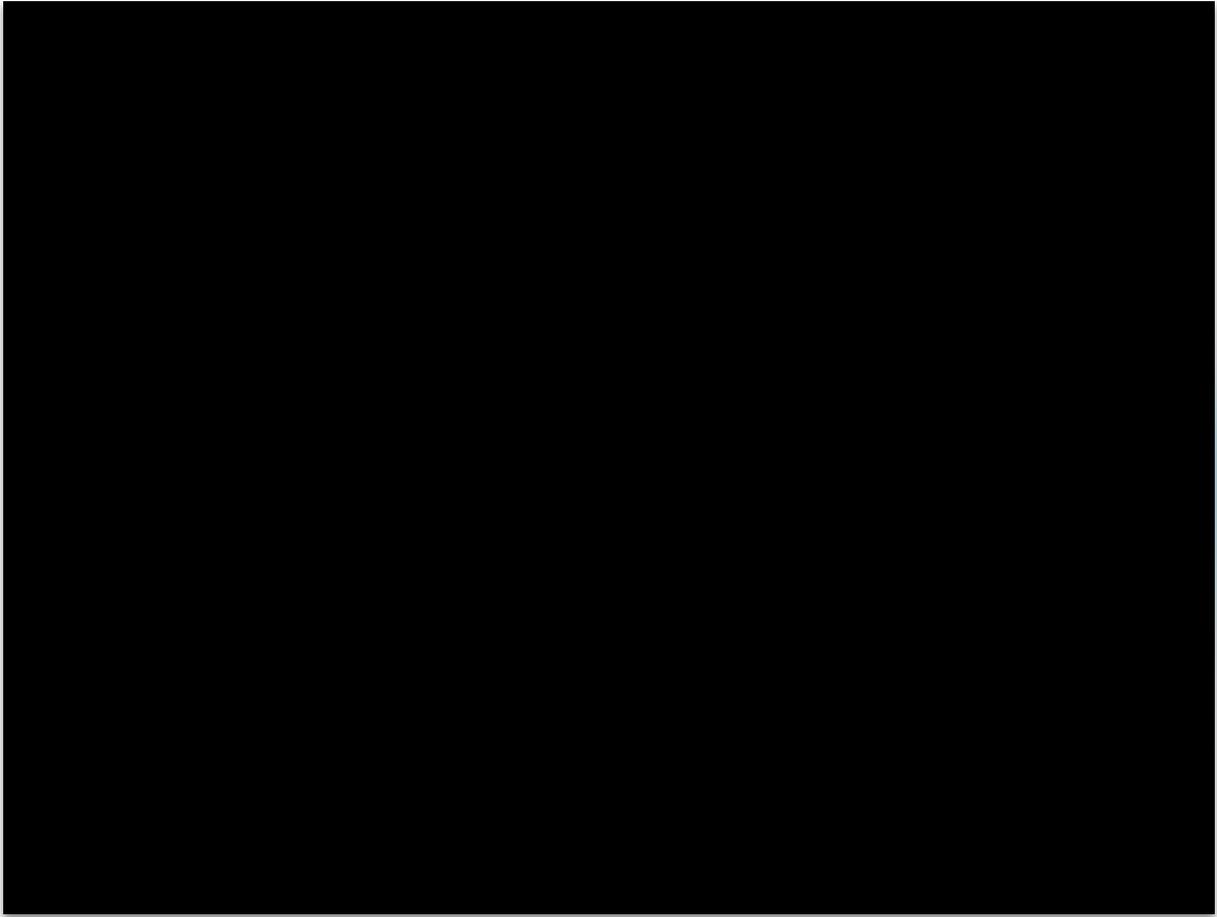

- No Hard Coded/Wizard of Oz Features
- Instead of hard coding values such as *Profile Information* or *Logbook Entries*, we implemented a **comprehensive mobile and web backend** in Supabase which captures real-time user data and is responsive with the UI to ensure an optimal, seamless user experience.
