Denon UD-M30 CD Player Review: A Fantastic but Flawed Product I'm thrilled with my Denon UD-M30 after using it to connect my iPod at the Apple Store today. The sound quality surpasses the iPod's docking station, filling my entire house with a noticeable difference. The unit has performed exceptionally well over the years, providing top-notch sound quality and sufficient power for various speaker setups. Although I've had minor issues with the volume control, these have been easily resolved by adjusting the settings. One of the biggest drawbacks is the lackluster customer service from Denon. After experiencing a problem with my unit after just under a month of use, I was quoted £200 to repair it, which is unacceptable given its age and poor repair history. However, many owners seem to be satisfied with their purchases, praising the product's sound quality, durability, and value for money. When combined with speakers like the B&W DM310, it provides an excellent high-end system at a budget-friendly price point. but reproduction is good on powerful local stations (probably needs more arial that I am using). System quality and appearance are excellent and the speakers are outstanding for their size. I will probably add a sub-woofer when I sort out a compatible one, but that does not mean the system lacks performance or presence with its little book shelf units. Highly recommended. My father got what is now my UD-M31 second hand, he had it for about 7 months, before he gave it me, and ive had the system at least 18 months, and i have had no problems at all. This hi-fi is my holy grail of sound, being my first upper market hi-fi, it has (obviously) blown my previous sony, sharp, panasonic systems out of the water, even though it is half the size and a third of the power, the sound is clear and precise, and in the right environment and the built in eq setting flat, makes a good 2nd best to my behringer dt100's (mixing/monitoring headphones renowned for having perfect sound reproduction) the low end wont shake your house down and that is why you get a subwoofer output :) but other than that the sound is gorgeous! not to mention how this system looks. I mostly use iTunes with my Denon, and a touch of EQ here and there does wonders, and if you have or are getting one of these, best to have the speakers set out properly, do this amazing little thing some justice :) the only reason this product didn't get a 5 for sound quality is my experience with Lynx systems. 10/10 for the Denon. Same old problem with the Denon UD-M31 - the volume knob does not work properly. Now the tuner has packed up. Item about 3 years old. Very disappointed... after 18 months I experienced a problem with the volume on my Denon UD-M31. I have had to replace the input/output circuit board, and now I need to replace the drive motor for the CD player. It appears you can only buy this part by buying the complete loading mechanism which will cost me approximately \$185. I am dissatisfied by all these major faults within 5 years. So much for Denon's reputation of quality! I want to use the tuner only, to feed a separate Amplifier system with its own speakers. Can I do this? and if so, from where do I take the Tuner output? the display just shows me 6 zeros. What has happened? to operate the Bass/Treble controls/Adjustment you need first to select SDB ON then you can adjust volume either on Treble or Bass by 1 to 5 points + or - using the fast back or forward keys. I have just purchased a receiver amplifier, it has no remote. Do I need anything else and can I get a manual? I have switched it on but have no sound, the display lights up. I do not have speakers just the above can you enlighten me please? Got a Denon UD M31 but no speakers. Which ones should I buy? Reach out to the company through their official website, or stop by a certified retail store for assistance.
